

# Boosting BSM Higgs discovery with jet substructure

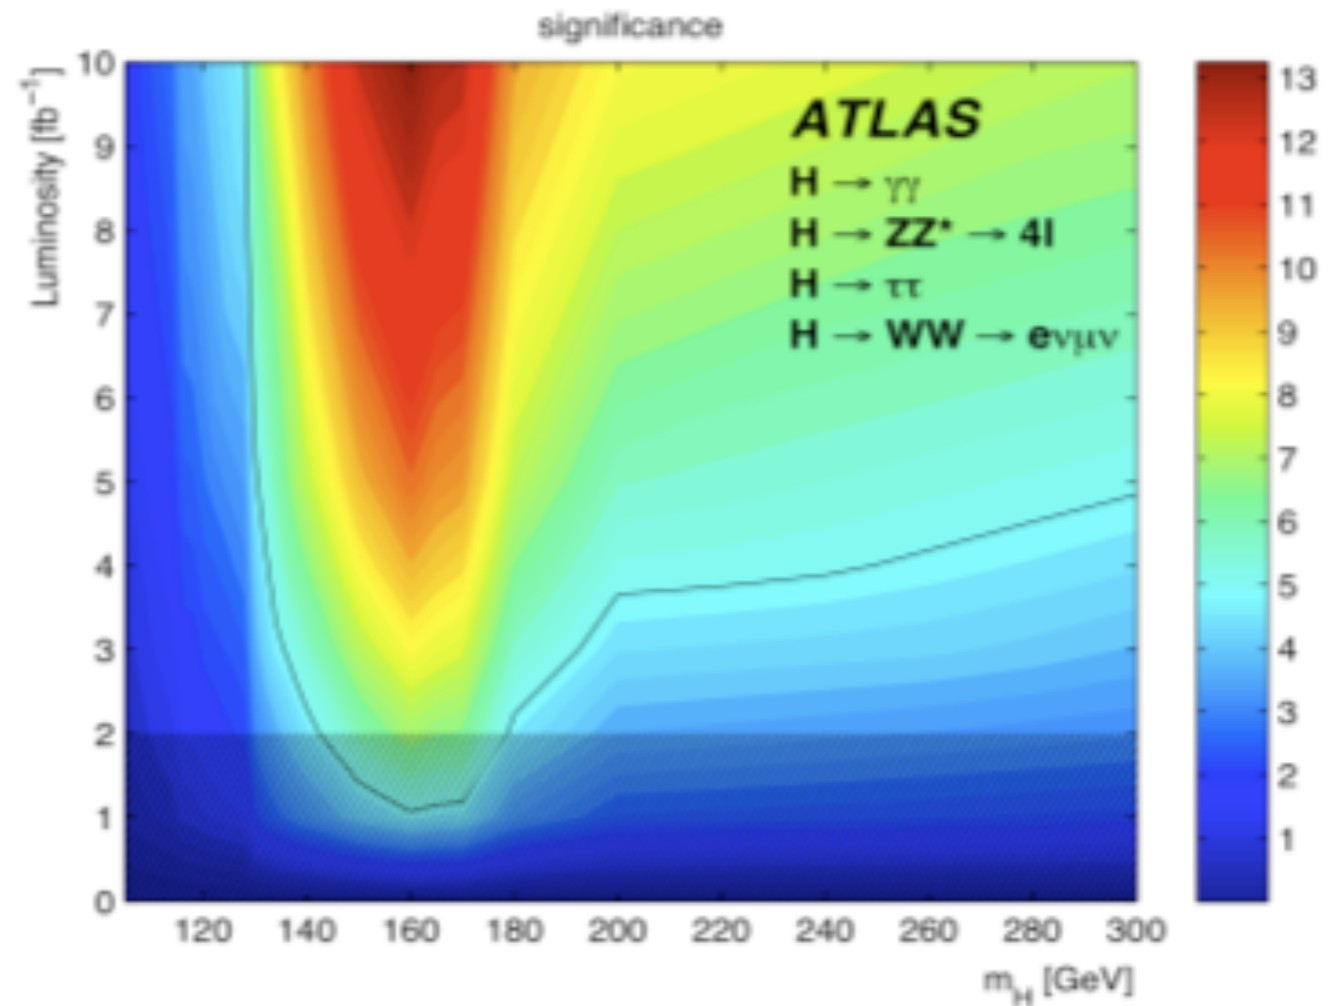

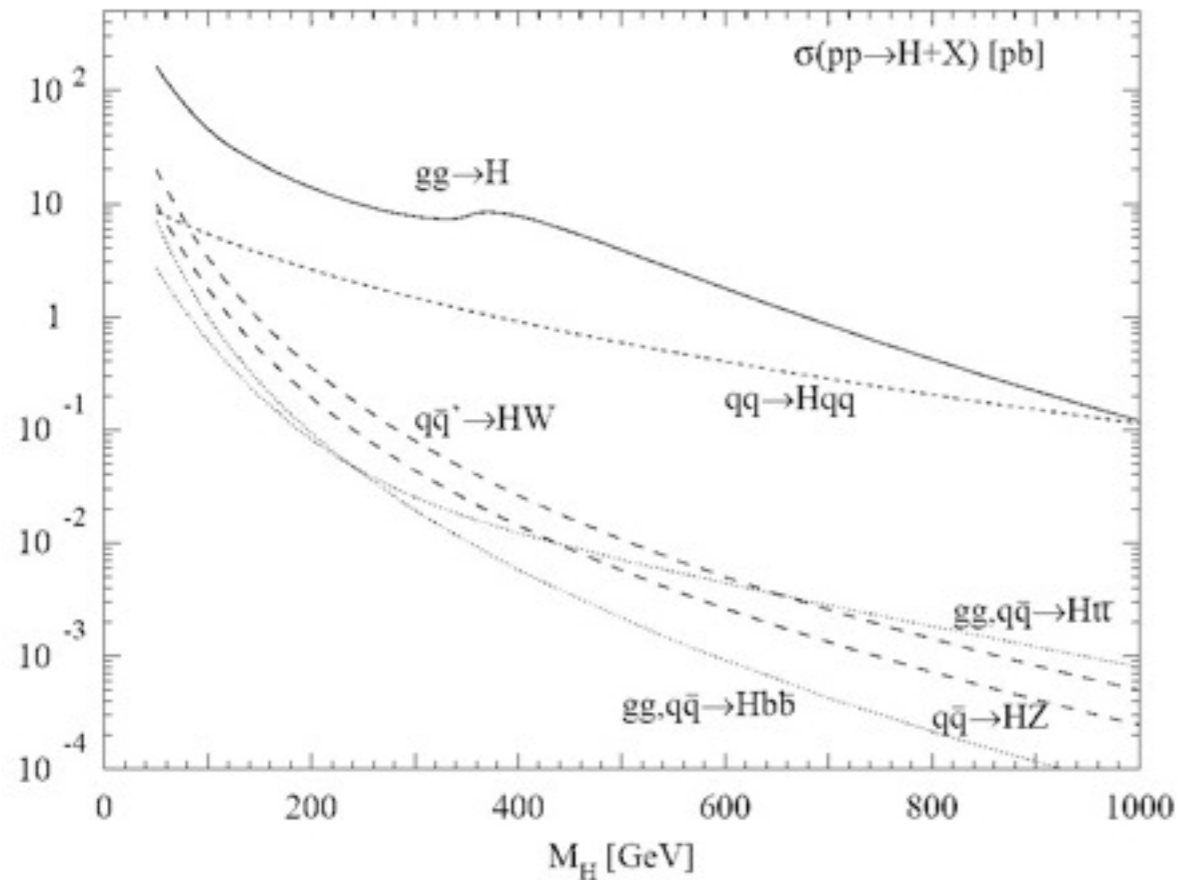

**Adam Martin ([aomartin@fnal.gov](mailto:aomartin@fnal.gov))**  
**with G. Kribs, T. Roy and M. Spannowsky (U. Oregon)**

**arxiv: 0912.4731**

Fermilab, Feb 18th, 2010

# Despite large LHC cross sections...

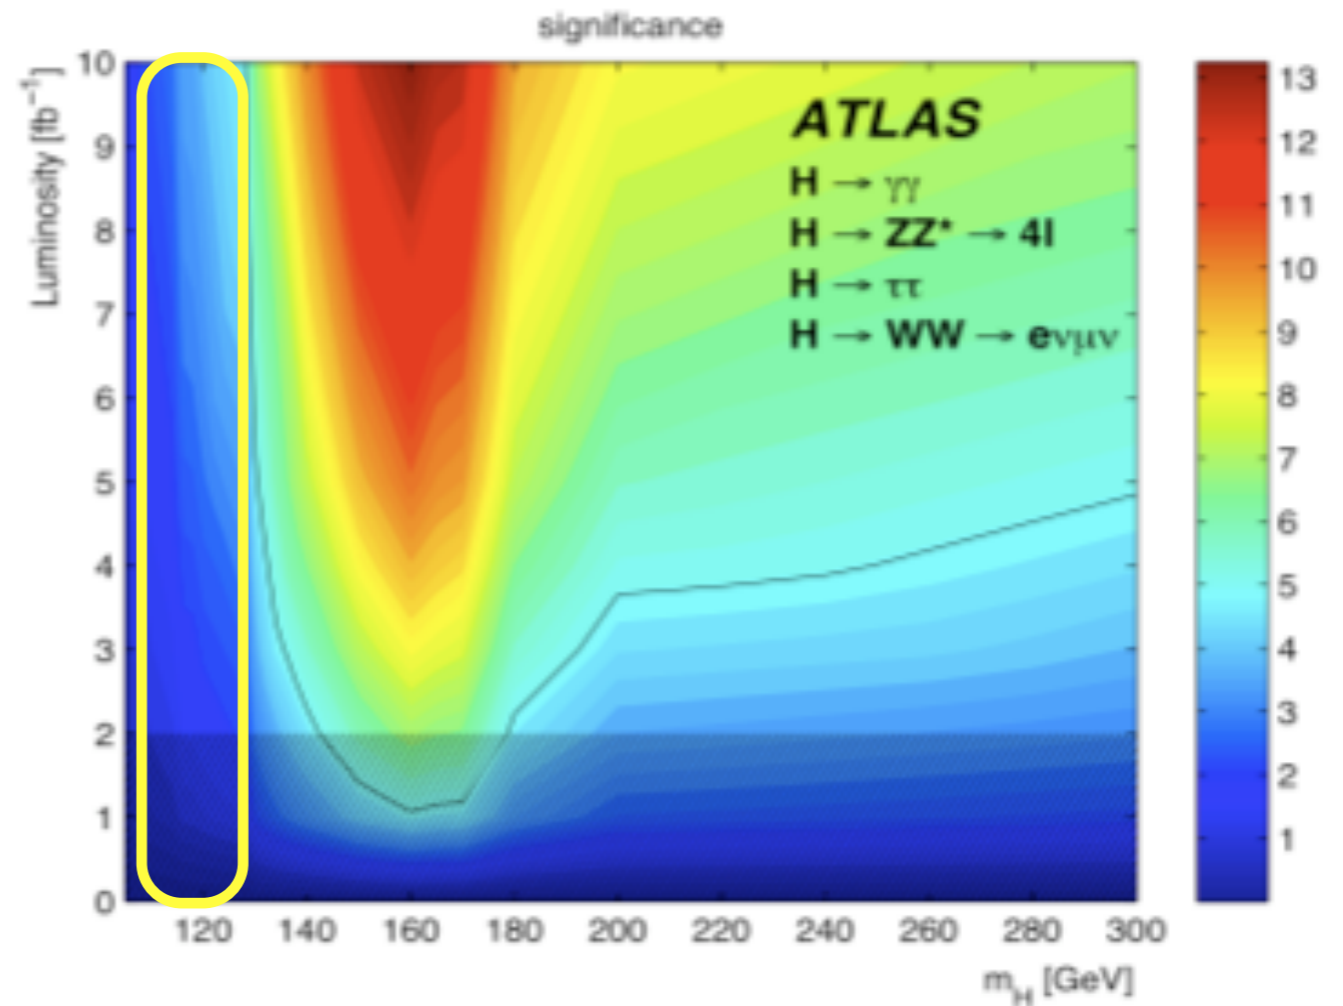

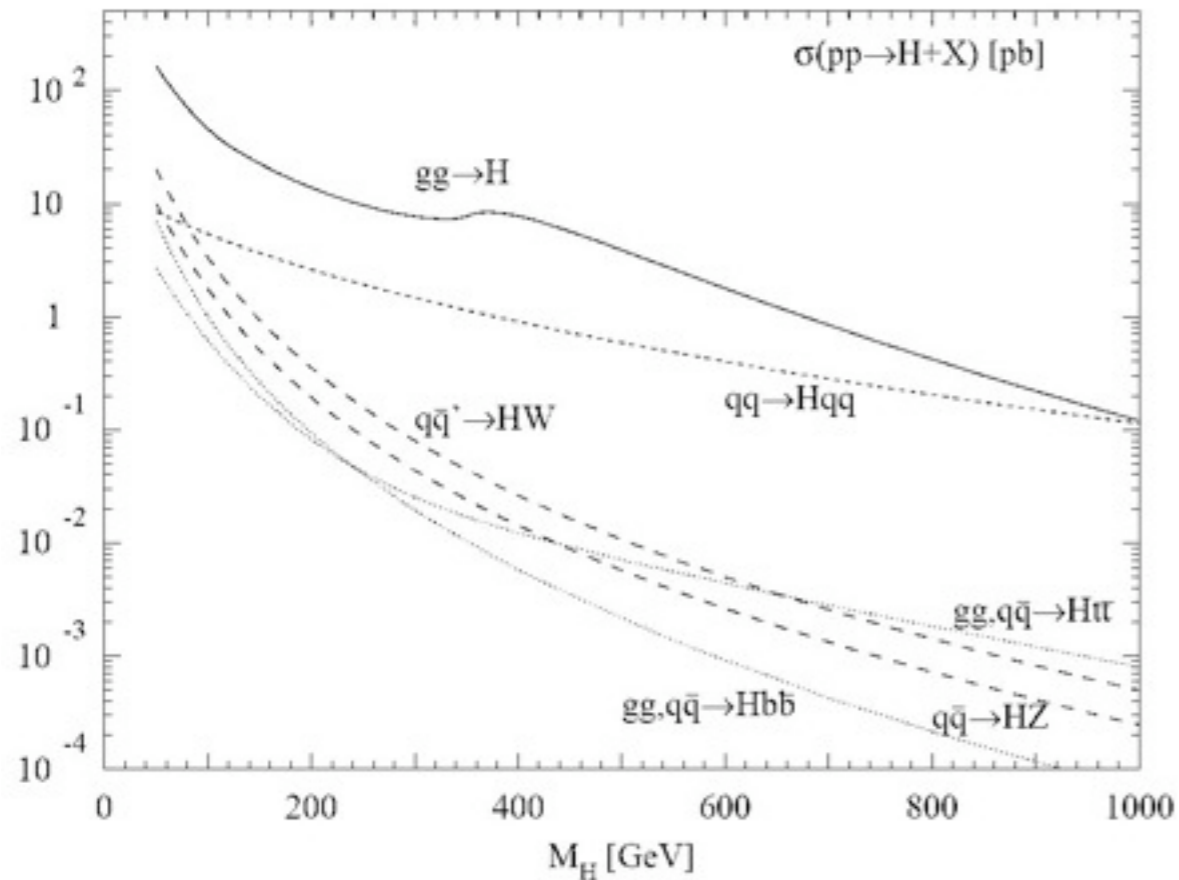

a light Higgs  $m_h \sim 115 - 130$  GeV, which decays primarily  $\sim 80\%$  :

$$h \rightarrow \bar{b}b$$

will be **difficult** to find

# Despite large LHC cross sections...

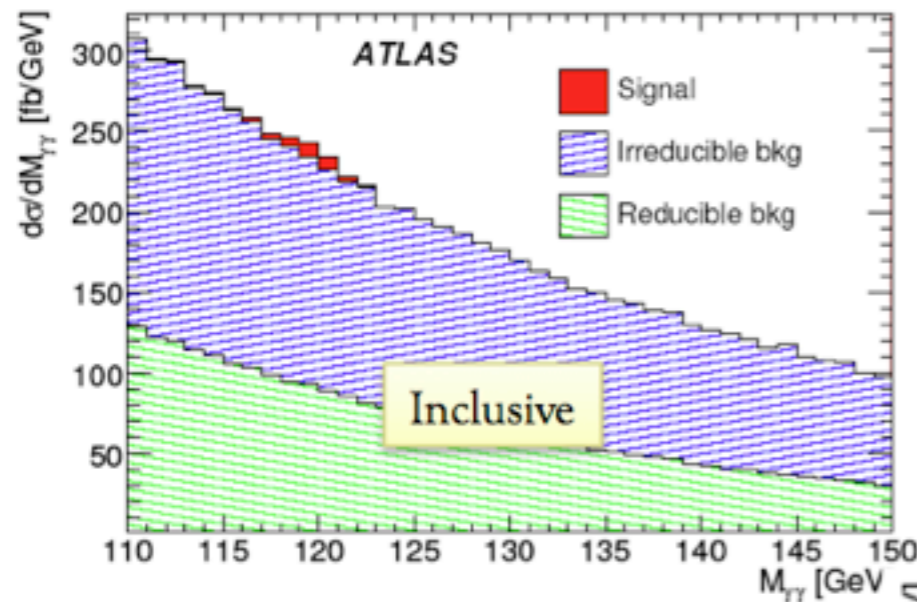

a light Higgs  $m_h \sim 115 - 130$  GeV, which decays primarily  $\sim 80\%$  :

$$h \rightarrow \bar{b}b$$

will be **difficult** to find

for the lightest mass range the most sensitive channel is  $h \rightarrow \gamma\gamma$

- reconstruct the diphoton invariant mass peak, on top of continuum diphoton background
- ATLAS: inclusive diphoton and exclusive  $\gamma\gamma + \text{jets}$  searches

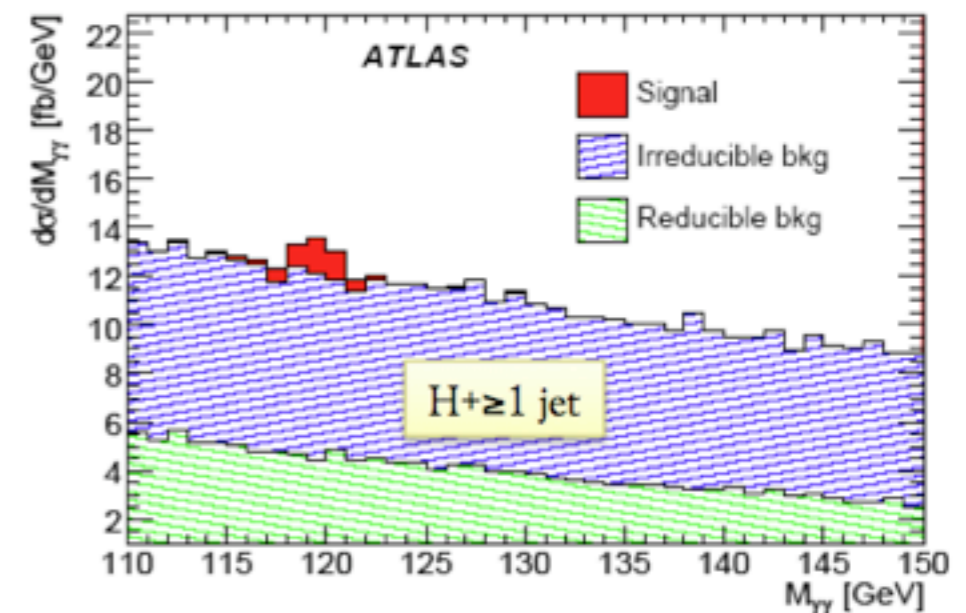

$$S/\sqrt{B} = 2.6$$

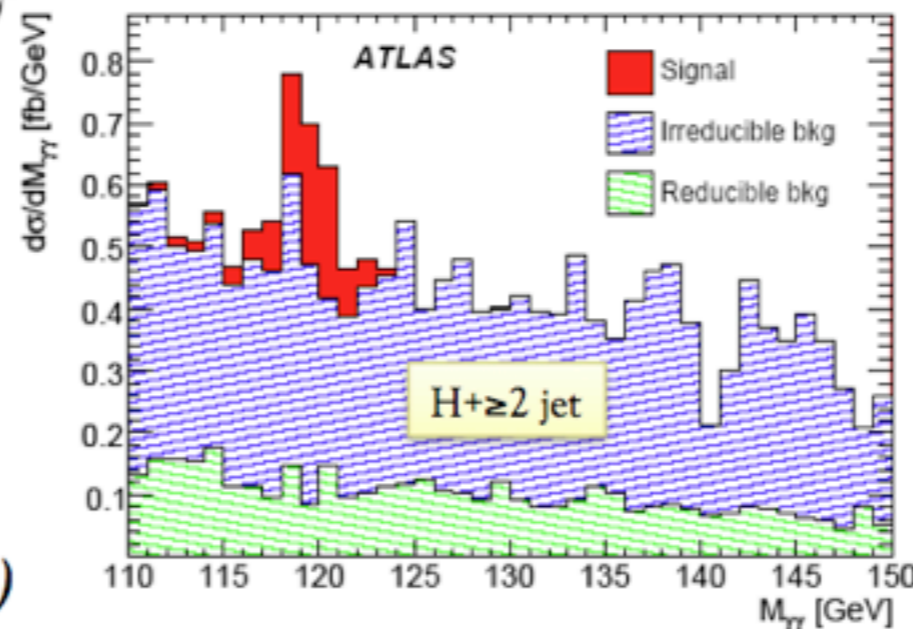

source (ATL-PHYS-2008-258)

for  $\mathcal{L} = 10 \text{ fb}^{-1}$

$$S/\sqrt{B} = 1.8$$

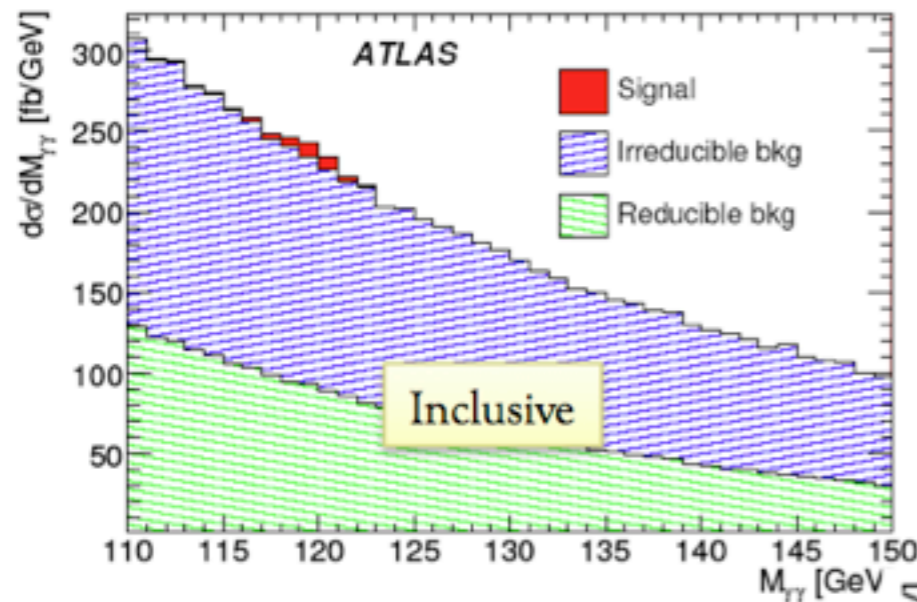

$$S/\sqrt{B} = 1.9$$

for the lightest mass range the most sensitive channel is  $h \rightarrow \gamma\gamma$

$$S/\sqrt{B} = 1.8$$

$$S/\sqrt{B} = 1.9$$

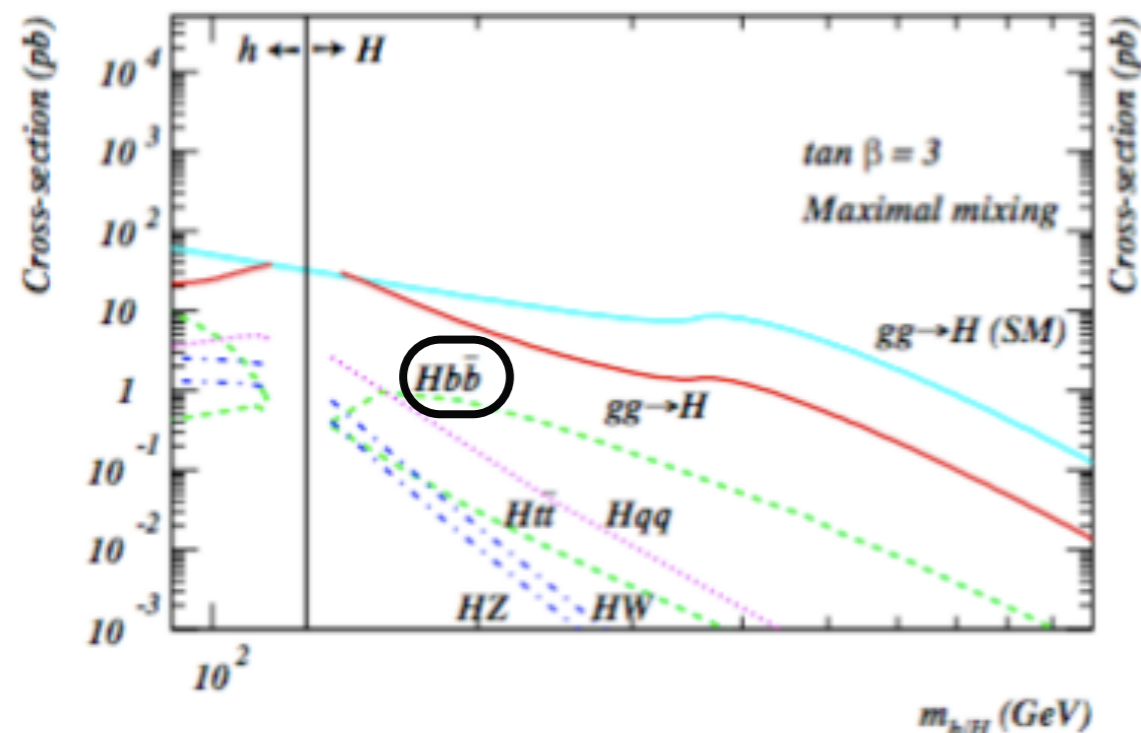

$hW(\ell\nu)/hZ(\ell\ell, \nu\nu)$

$h \rightarrow \tau\tau$

also contribute,  
but small

# Going beyond the SM... light Higgs still hard

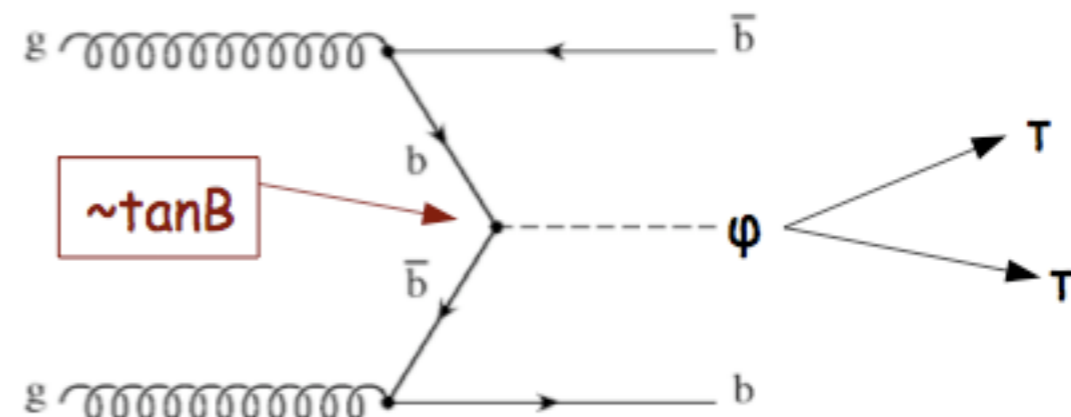

ex.) MSSM

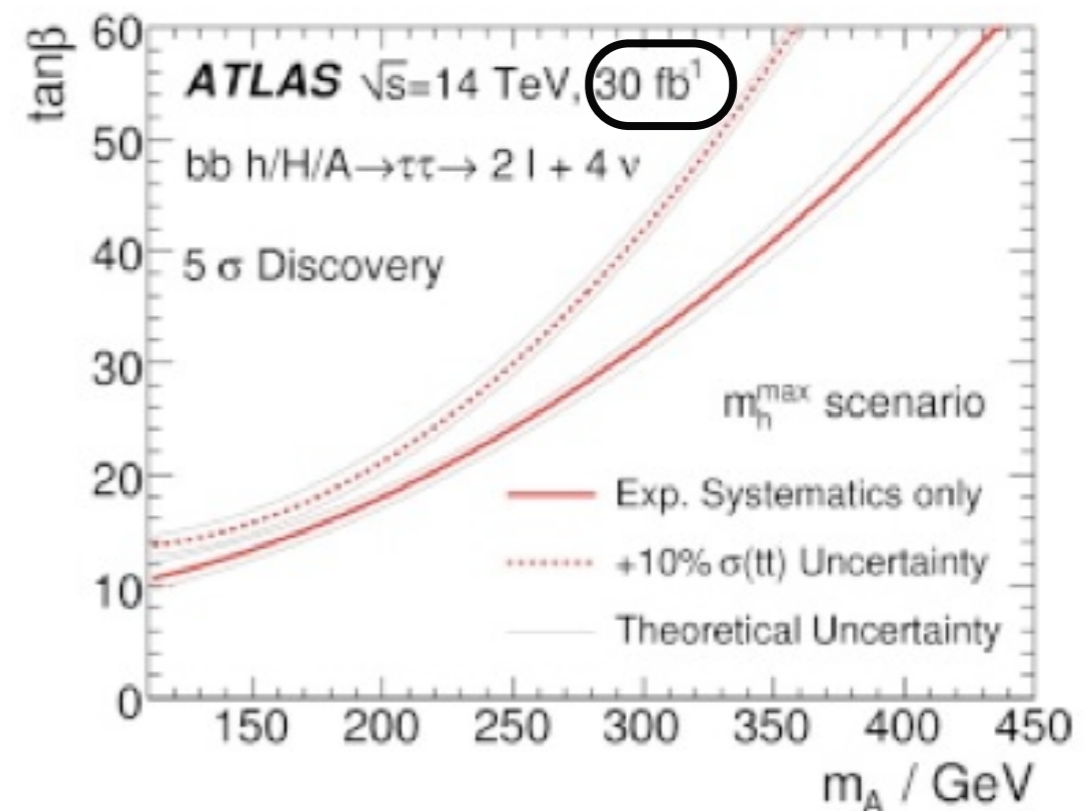

some enhancement, but only  
when  $m_A$  is small and  
 $\tan \beta$  is large

flavor problems?

conventional MSSM light  
higgs search

$bb \ h/H/A \rightarrow 2l + 4\nu$

# Recently, a new technique for light Higgses

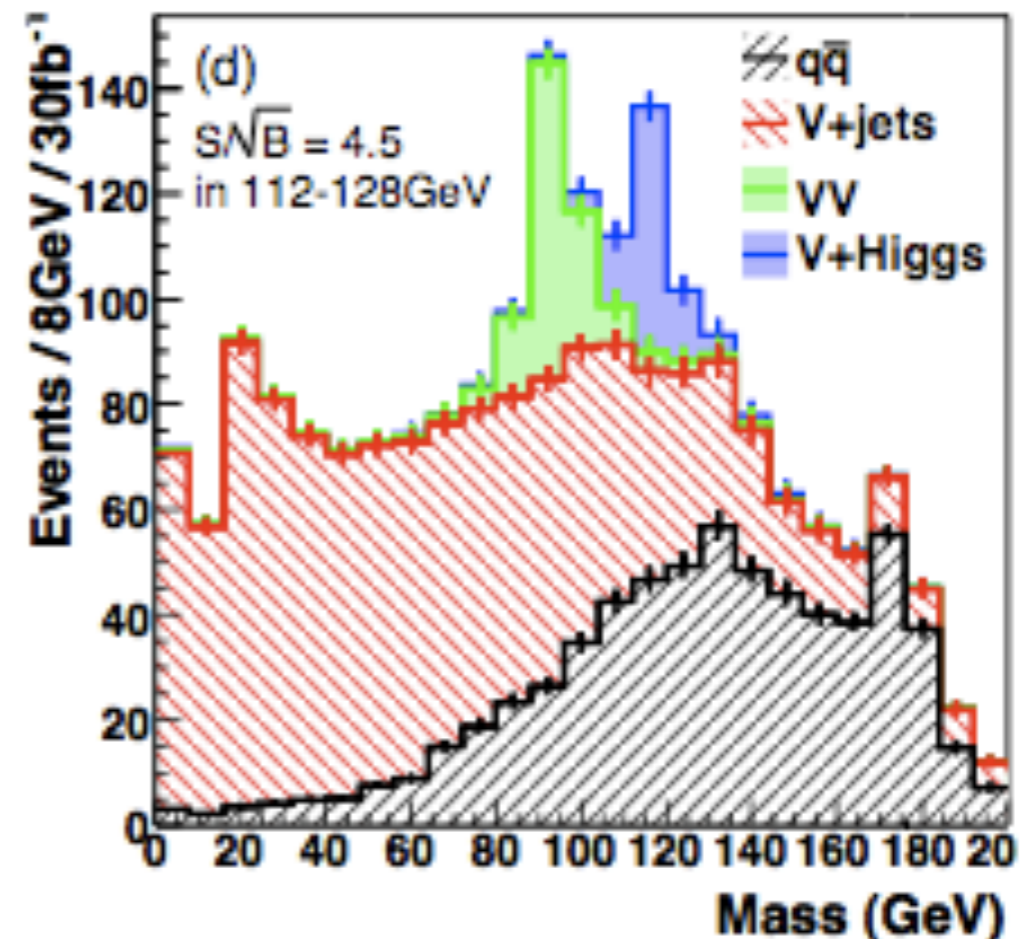

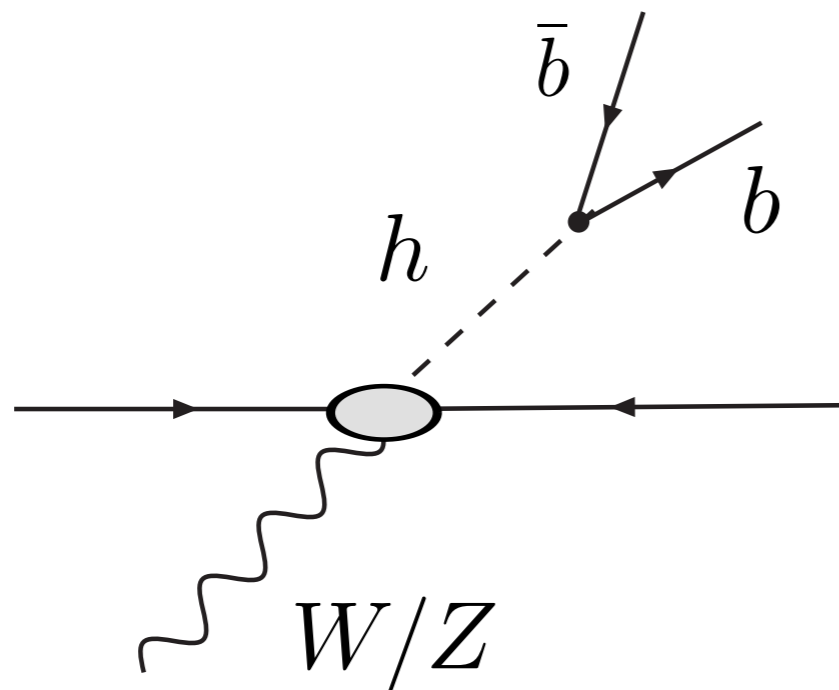

(Butterworth, Davison, Rubin, Salam '08)

In associated production of Higgs + **Z,W**:  $W(\ell\nu)/Z(\ell\ell) + h(\bar{b}b)$

significance  $\sim 4.5$  for  $\mathcal{L} = 30 \text{ fb}^{-1}$  ( $\sim 2.6$  for  $\mathcal{L} = 10 \text{ fb}^{-1}$ )

obtained by focusing on

**boosted Higgses**,  $p_{T,h} > 200 \text{ GeV}$

# Recently, a new technique for light Higgses

## Basic Idea:

**signal:** high  $m_{b\bar{b}}$ ,  $R_{b\bar{b}}$  depends on boost

**background:** high  $m_{b\bar{b}}$  at large  $R_{b\bar{b}}$

$$m_{ij}^2 \sim 2 p_{Ti} p_{Tj} (R_{ij})^2$$

**boosted regime:** high  $m_{b\bar{b}}$  smaller  $R_{b\bar{b}}$

Boosted objects appear as a single 'fat jet' in the detector..  
to dig out the b-jets from a 'fat jet' use recently developed  
**jet substructure techniques**

# Other Applications of Boosted analysis

- two-pronged decays (SM Higgs):

Butterworth, Davison, Rubin, Salam (2008)

- three-pronged decays (boosted top):

Kaplan, Rehermann, Schwartz, Tweedie (2007)

Brooijmans (2008)

Thaler and Wang (2008)

Butterworth, Ellis, Rakhlev, Salam (2009)

- jet pruning/trimming:

Ellis, Vermilion, Walsh (2009)

Krohn, Thaler, Wang (2009)

# Boosted Higgses

interesting new approach

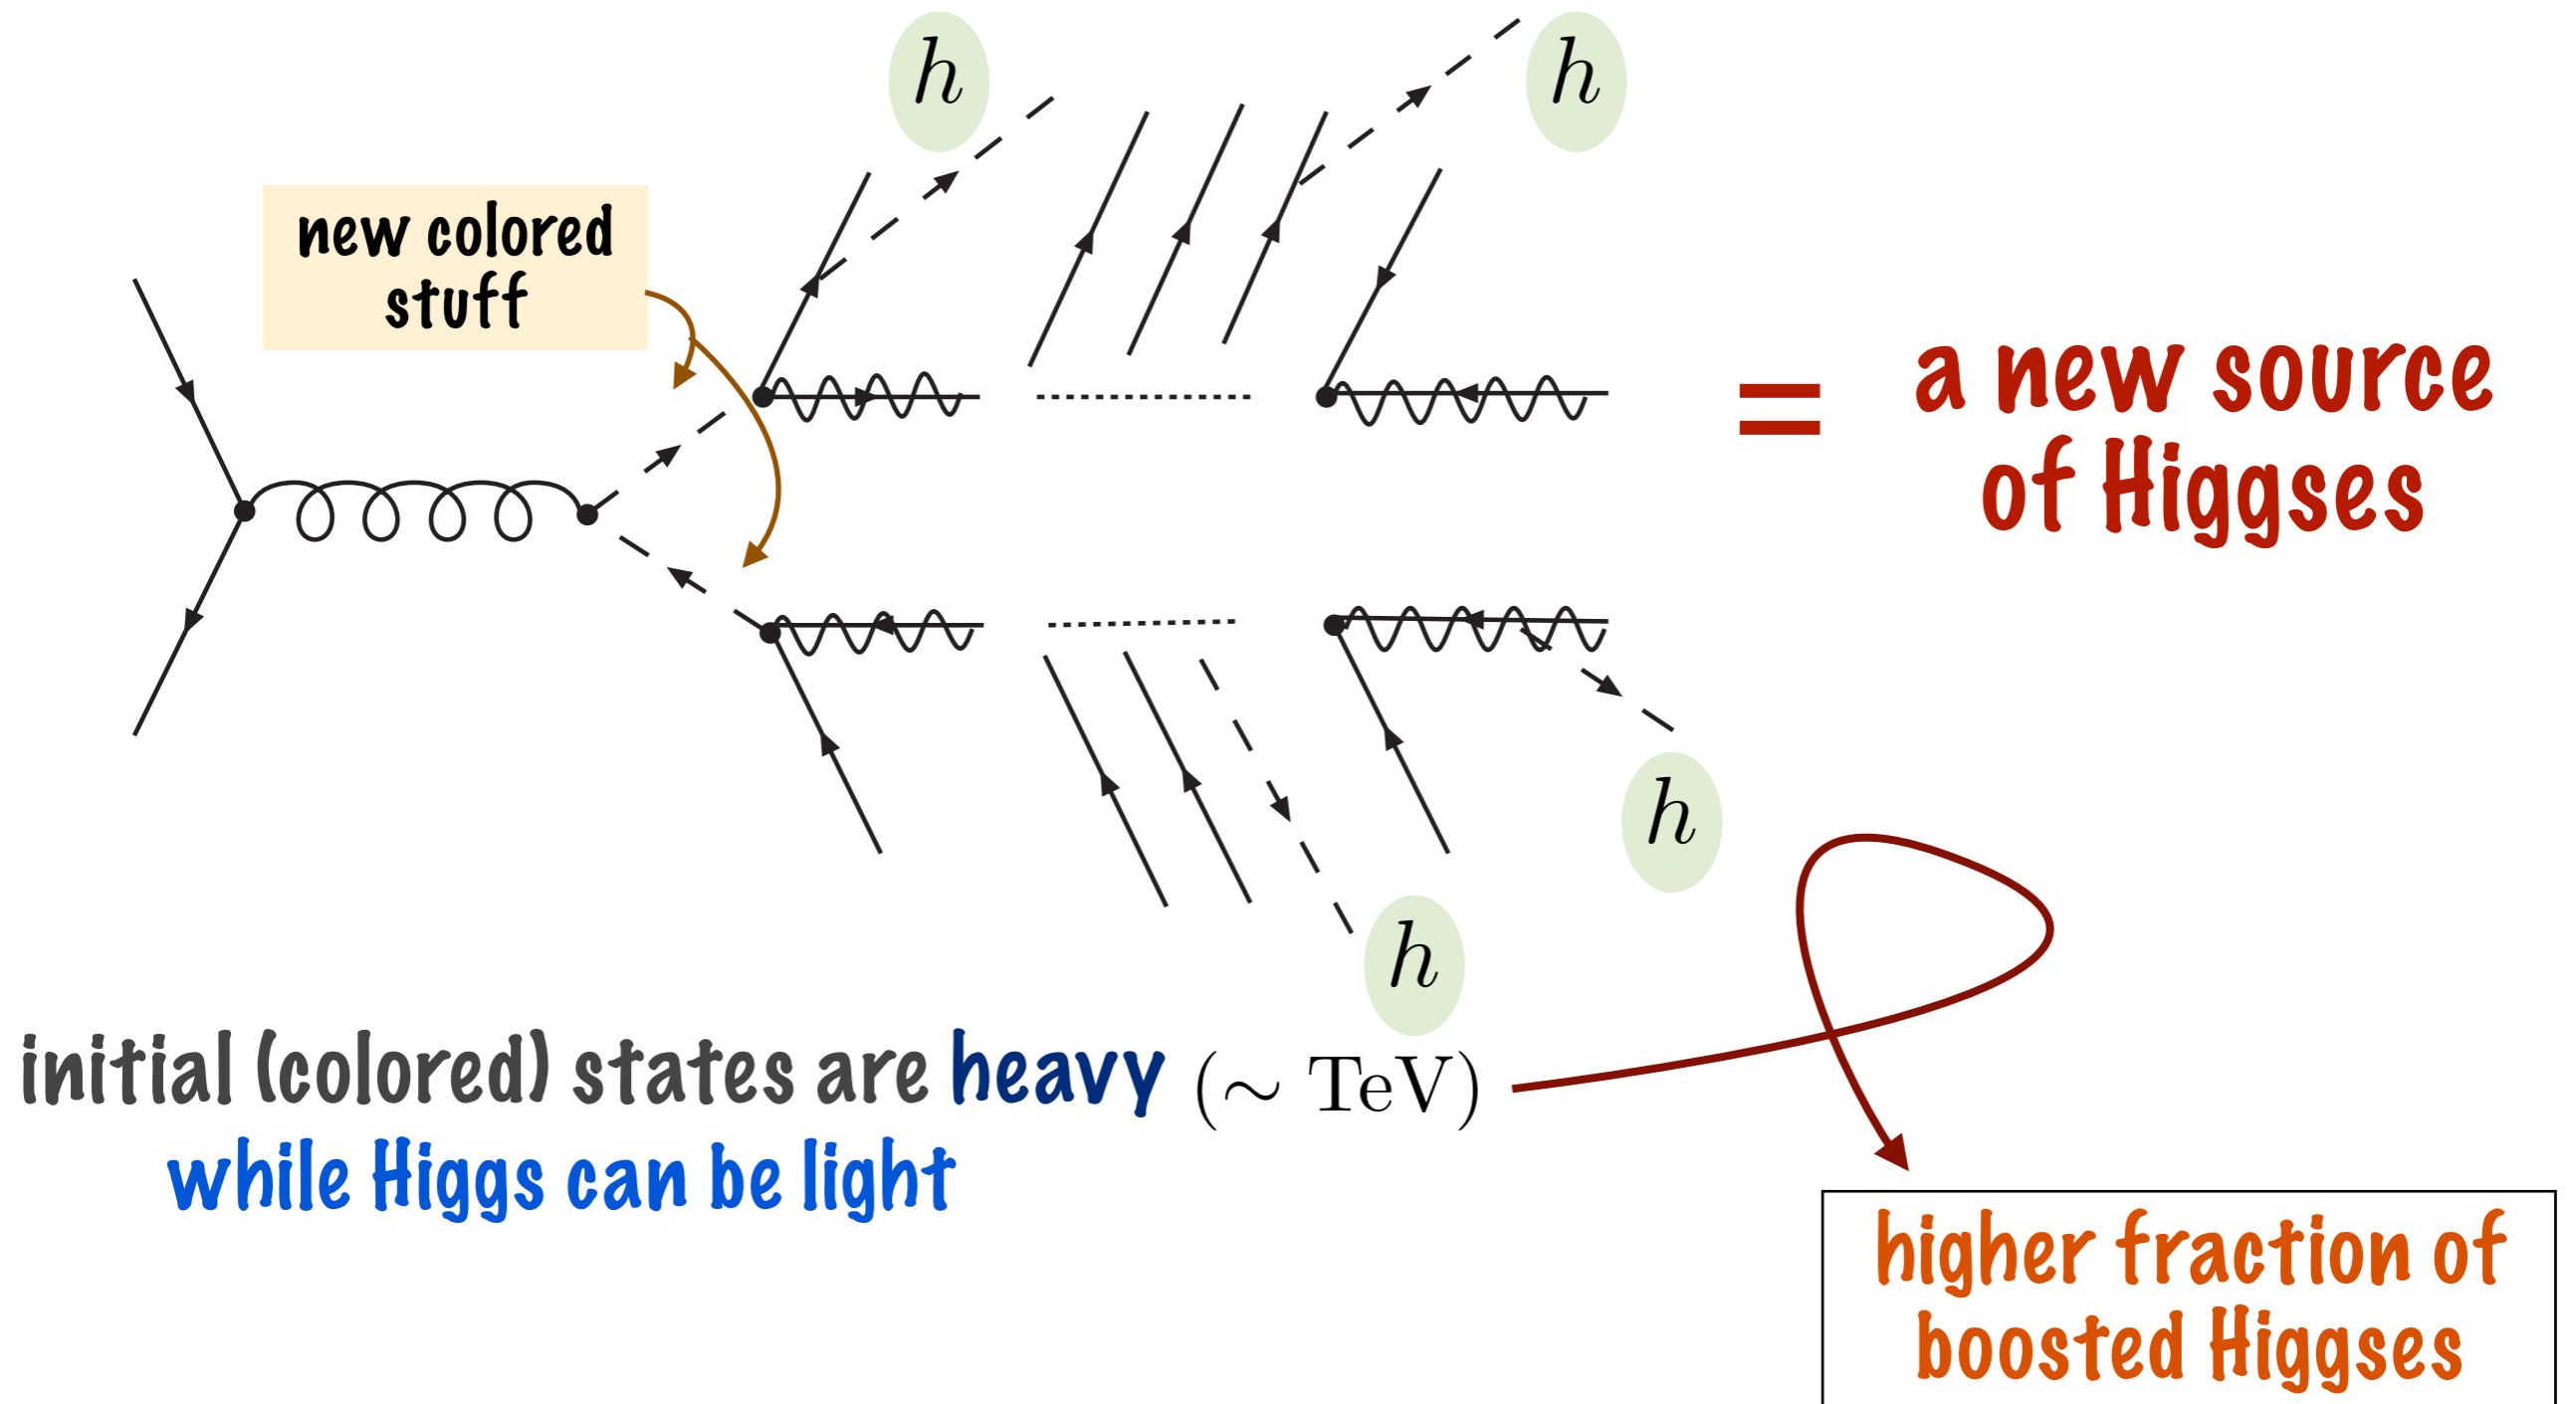

**BUT** a bit limited in SM

- \* boosted Higgs are rare in the SM:  $\sim 5\%$  in  $H + W/Z$
- \* need to trigger & suppress SM backgrounds: limited to  $W/Z$  leptonic decay modes

**What about jet substructure analysis + BSM?**

# Higgs from BSM

BSM particles can decay to Higgses

# Higgs from BSM

If BSM contains new colored states, production at LHC is easily in the  $\sim$  **few pb range**

comparable to or greater than  
SM EW Higgs production

**BSM production often comes with new, effective handles for suppressing SM backgrounds**

$\cancel{E}_T$ , high  $-p_T$  jets,  $\ell$ ,  $\gamma$ ,  $H_T$ ,  $\dots$

A diagram consisting of a central rectangular box with a red border. Six red curved arrows point towards this box: three from the left and three from the right. The arrows from the left point to the top-left, middle-left, and bottom-left corners. The arrows from the right point to the top-right, middle-right, and bottom-right corners.

**Higgses from BSM have all of the important ingredients for a successful substructure analysis**

# the plan:

Substructure Techniques +  
BSM = an opportunity for  
light Higgs discovery

Pick a **new physics** scenario which gives us a  
source of boosted Higgses

Use **substructure techniques** in these scenarios to  
combat backgrounds, both from the SM  
and from new physics

**Adapt substructure** to work in hectic, crowded  
BSM environments

# Part I: SUSY sources of boosted Higgs

Though our techniques apply to a wide array of BSM scenarios, we'll look at (weak scale) SUSY

## why SUSY?

- **MSSM Higgs has to be light**  $m_h \lesssim 130 \text{ GeV}$ ,  
decays dominantly to  $b\bar{b}$
- **it has new colored particles (squarks, gluinos), which can be produced with large cross sections**
- **all events include  $\cancel{E}_T$**
- **Higgs via various decays:**

$$\tilde{\chi}_2^0 \rightarrow \tilde{\chi}_1^0 + h$$

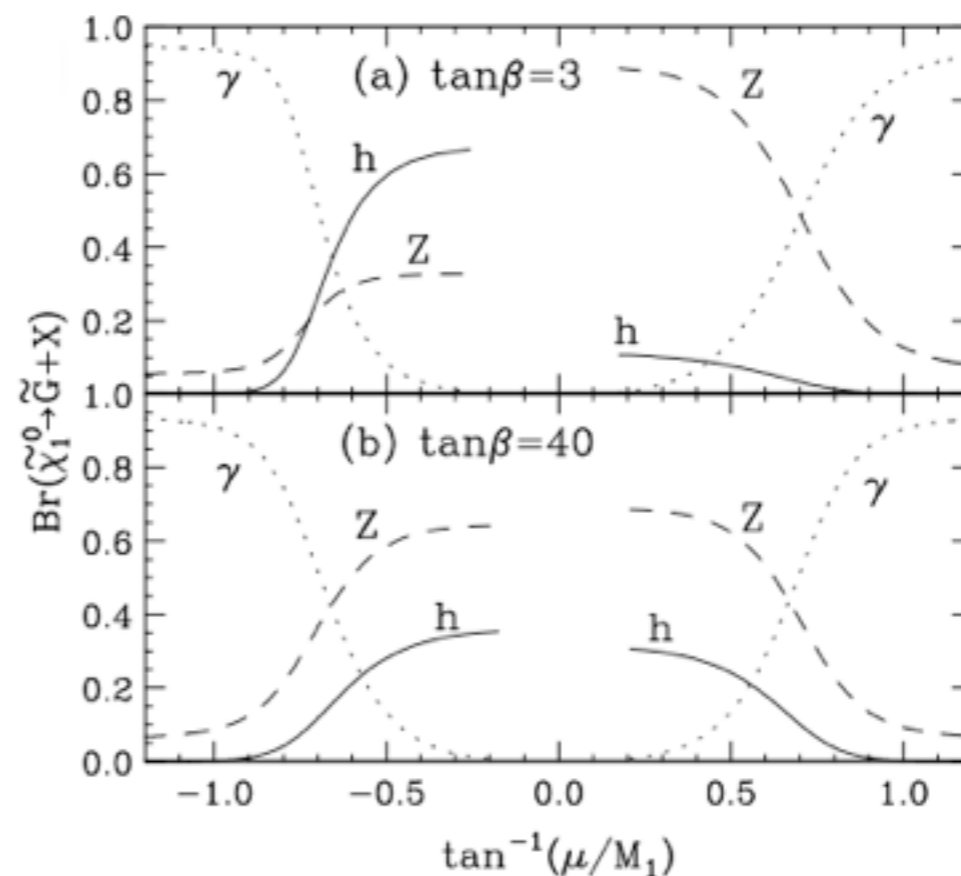

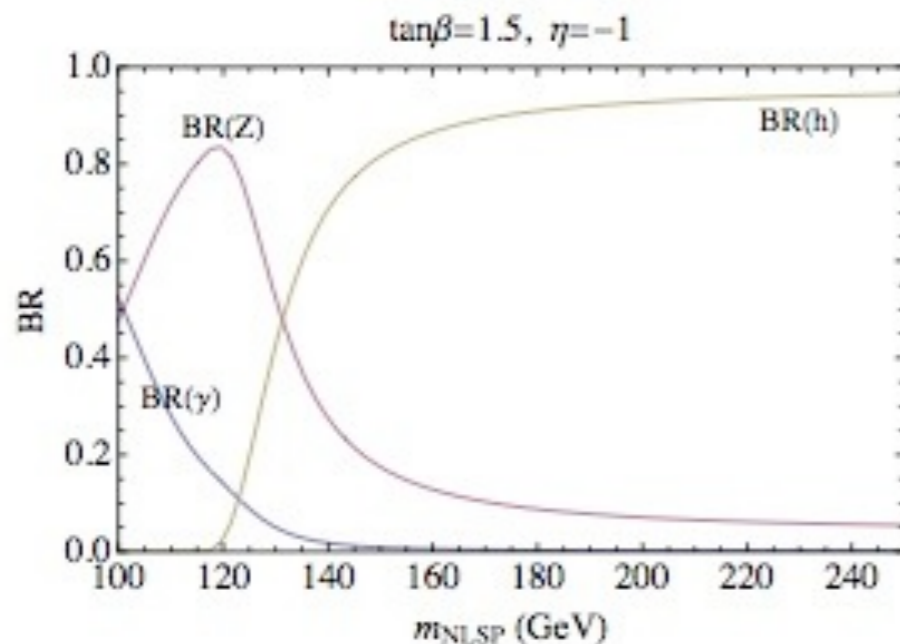

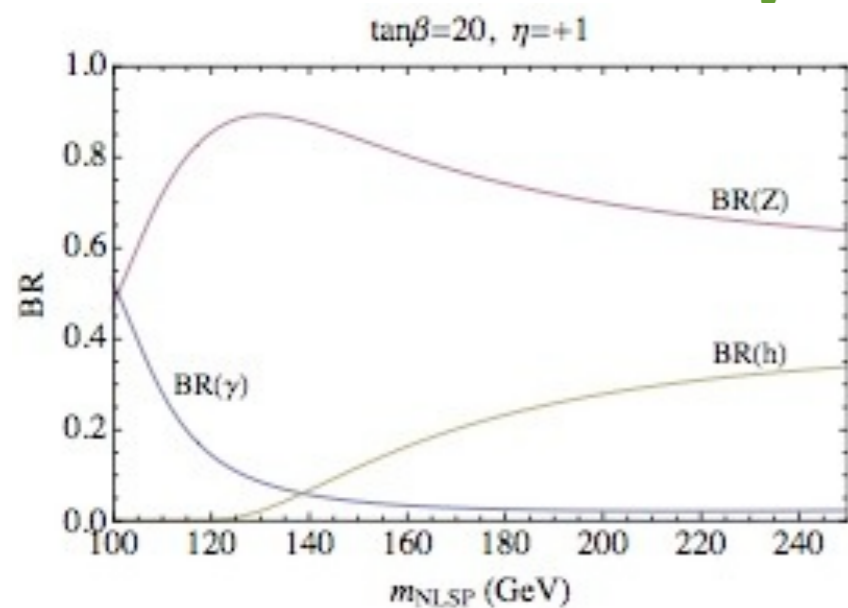

$$\tilde{\chi}_2^\pm \rightarrow \tilde{\chi}_1^\pm + h$$

$$\tilde{t}_{L,R} \rightarrow \tilde{t}_{R,L} + h$$

$$\tilde{\chi}_1^0 \rightarrow \tilde{G} + h$$

# Neutralino Decays to Gravitinos

- happens when the scale of SUSY breaking is low (GMSB)
- decays of neutralinos governed by  $M_1, M_2, \mu, \tan \beta$
- can get appreciable BR to Higgses when the lightest neutralino is **primarily Higgsino**  $|\mu| \ll M_1, M_2$

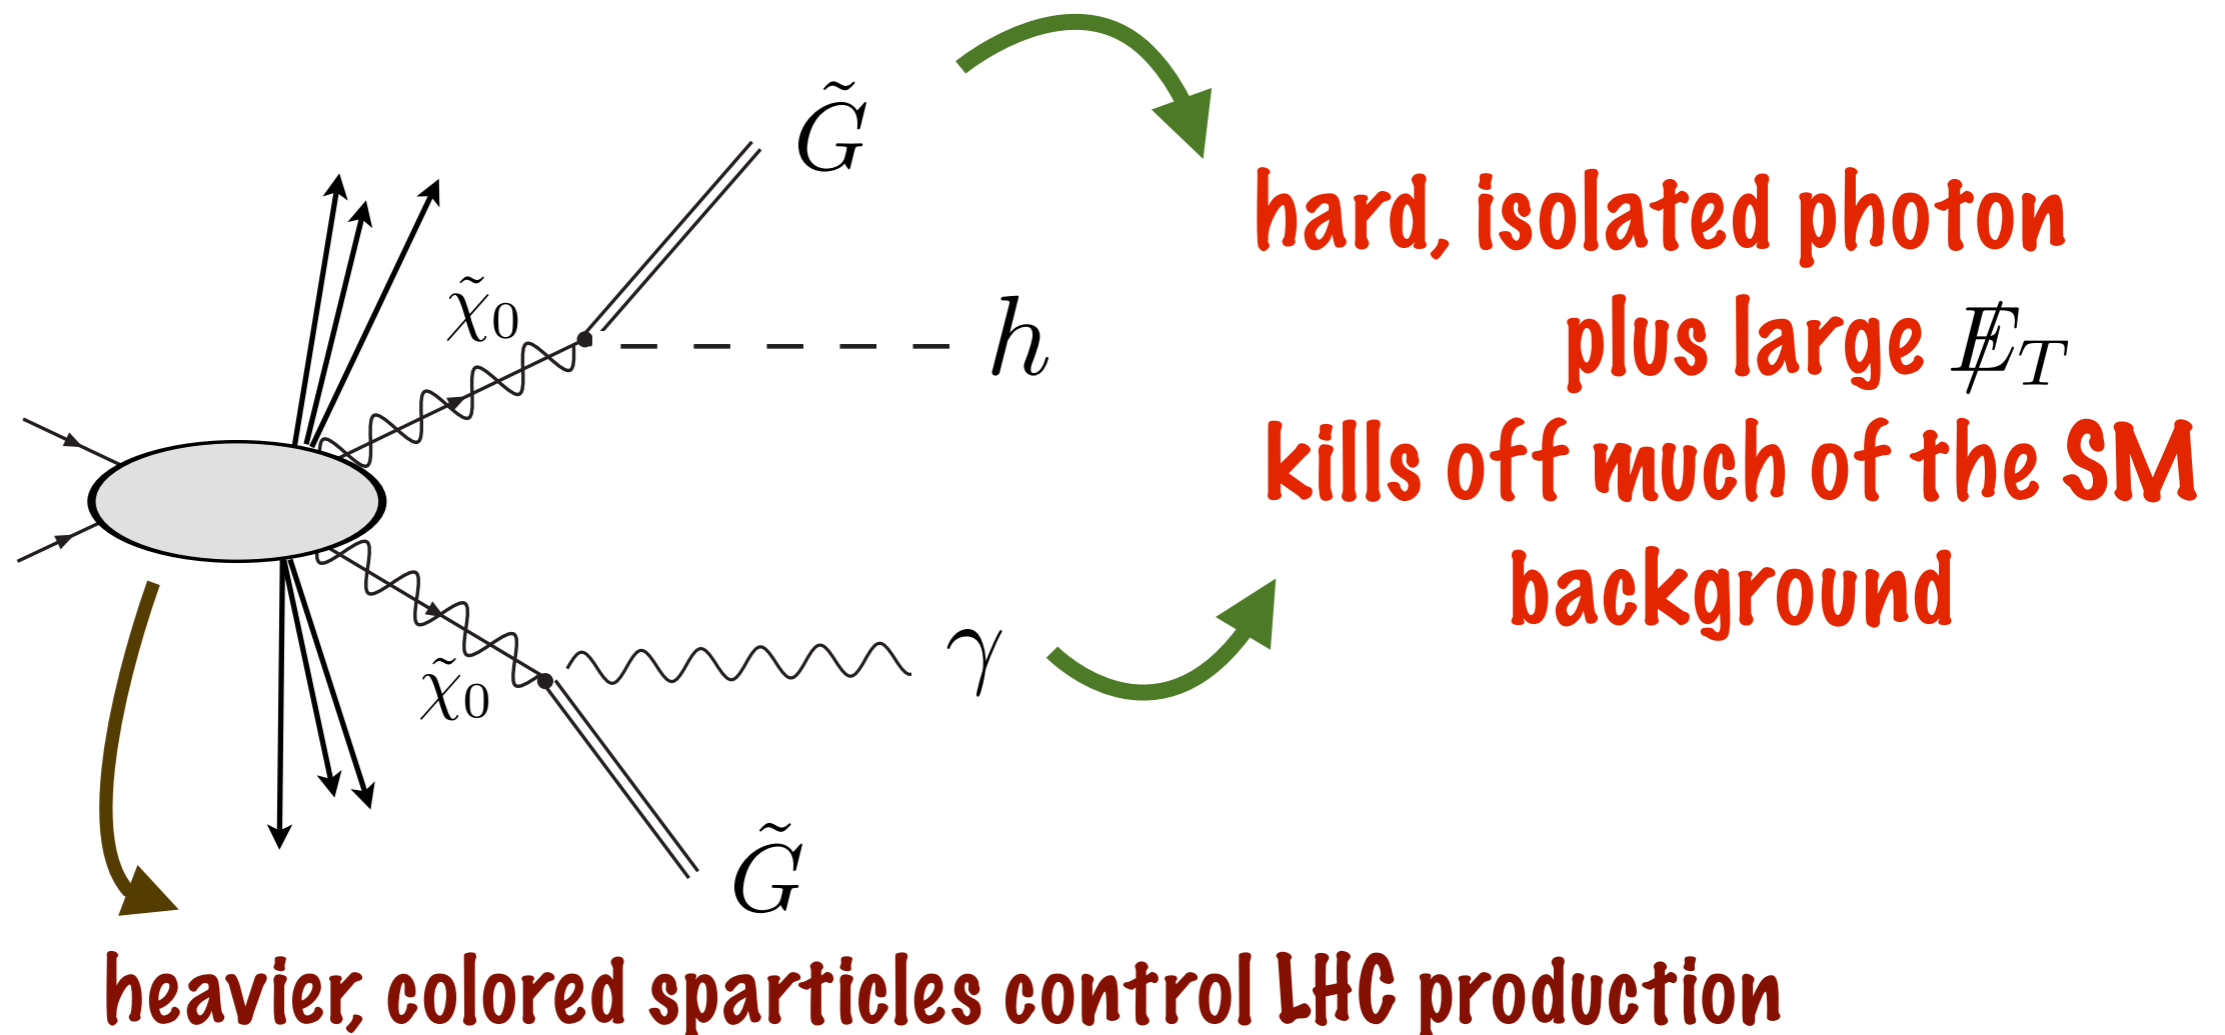

(Matchev, Thomas '99)

(Meade, Reece, Shih '09)

# Why start with $\tilde{\chi}_1^0 \rightarrow \tilde{G} + h$ ?

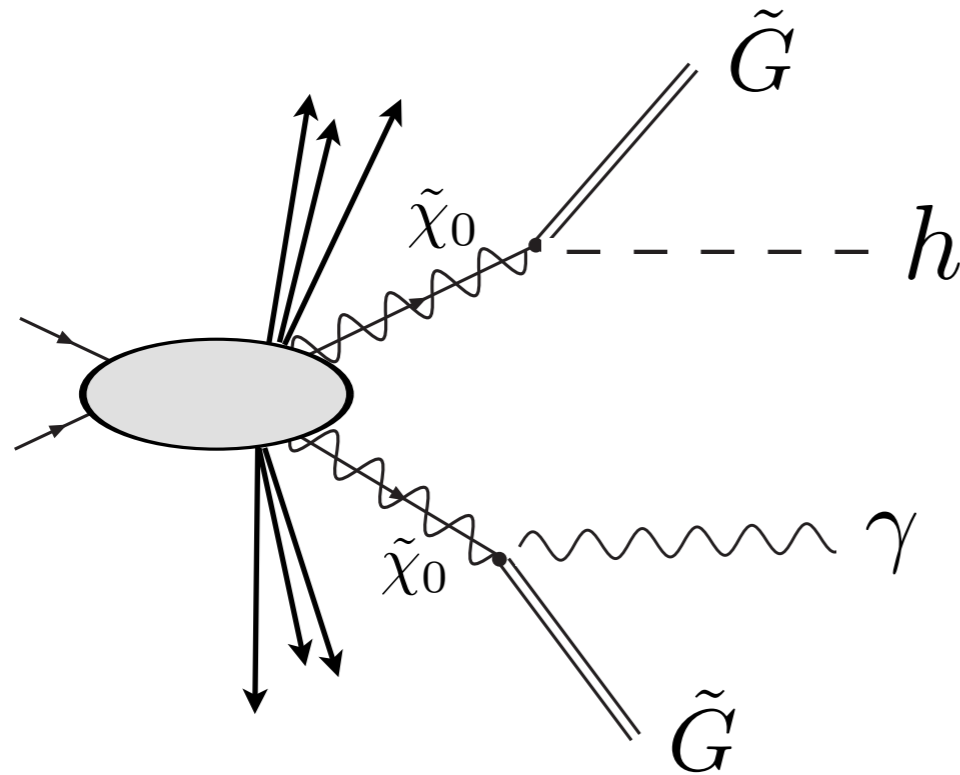

- **The mixed decay  $\tilde{\chi}^0 \tilde{\chi}^0 \rightarrow h + \gamma + \cancel{E}_T$   
has a smaller rate, but many advantages**

- **simplest BSM scenario we could think of to test jet substructure techniques on**

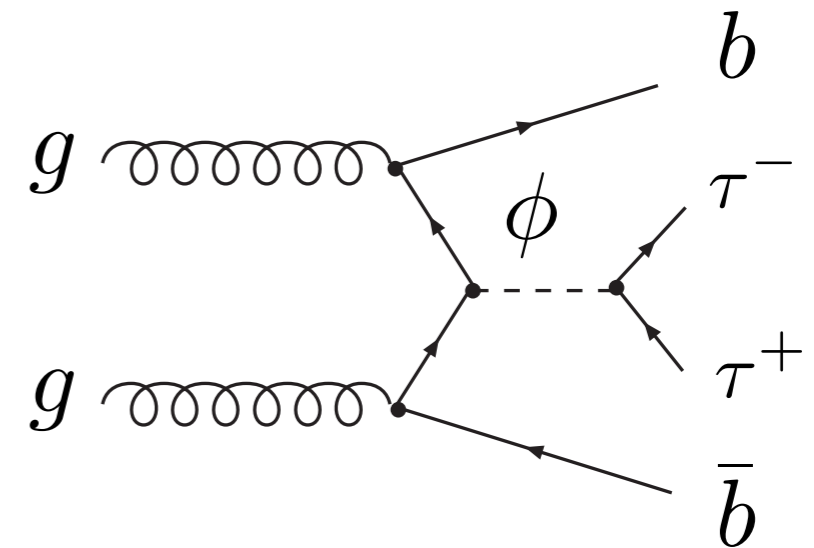

# Higgses source comparison

how we want to look for the MSSM Higgs

- Higgses from sparticle decays
- big cross-section (inclusive SUSY prod.)
- all events have  $\cancel{E}_T$ , lots of extra jets
- SM and BSM backgrounds

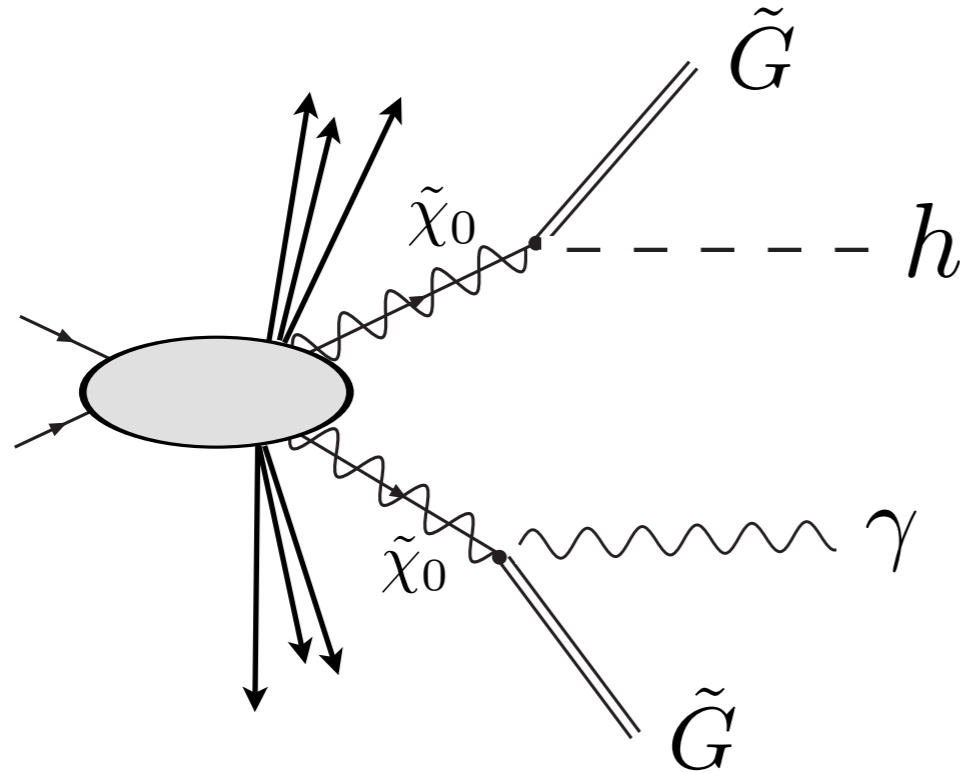

how people usually look for the MSSM Higgs

- Higgs produced in association with SM particles
- smaller cross section (set by  $y_b$ )
- no (BSM)  $\cancel{E}_T$
- only SM backgrounds

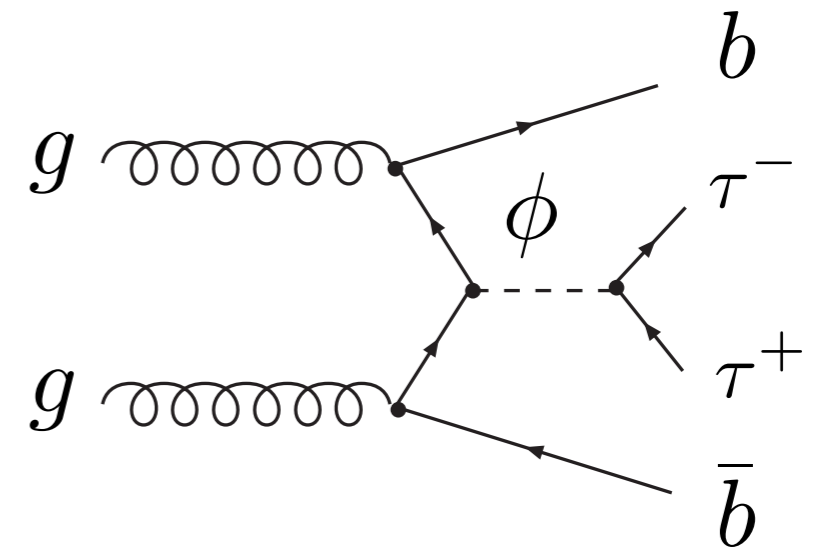

# Higgses source comparison

how we want to look for the MSSM Higgs

- Higgses from sparticle decays
- big cross-section (inclusive SUSY prod.)
- all events have  $\cancel{E}_T$ , lots of extra jets
- SM and BSM backgrounds

how people usually look for the MSSM Higgs

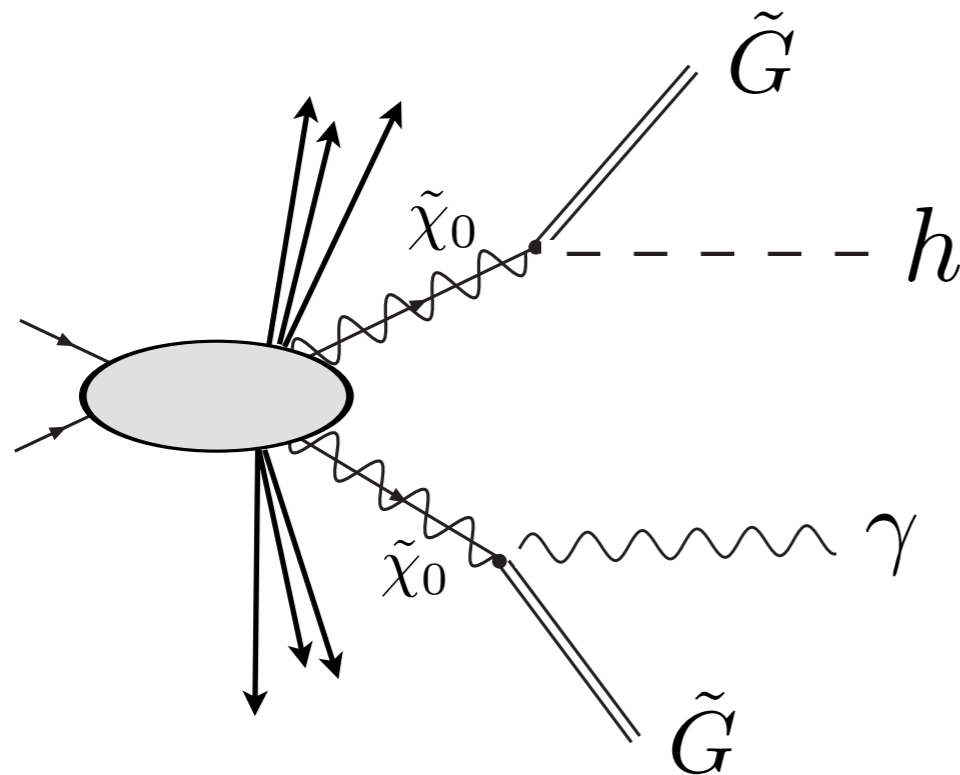

- Higgs produced in association with SM particles
- smaller cross section (set by  $y_b$ )
- no (BSM)  $\cancel{E}_T$
- only SM backgrounds

with so much going on in inclusive SUSY events... how can we do better than traditional search?

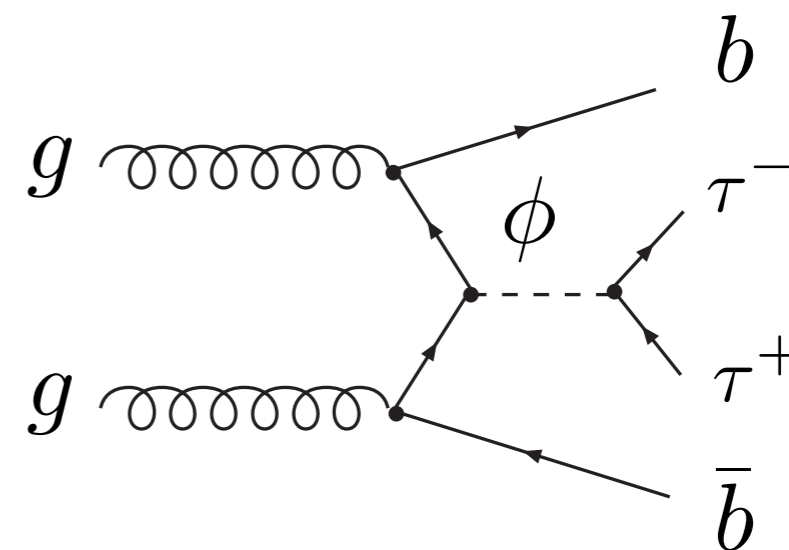

# Higgses source comparison

how we want to look for the MSSM Higgs

- smaller cross section (set by  $y_b$ )
- no (BSM)  $\cancel{E}_T$
- only SM backgrounds

**JET SUBSTRUCTURE!**

# Remember

- \* focus on the subset of new physics events with boosted characteristics

specifically, demand  
one or more 'fat' jets:  $p_{T,j} > 200 \text{ GeV}$

this limits the kinematic regime, costing us events,  
but we greatly reduce combinatorial background

- \* Our goal is to discover the Higgs, not the new physics!
- \* also, going to high- $p_T \longrightarrow$  better detector resolution:

ex., for jets:  $\left(\frac{\delta E}{E}\right)_{\text{jets}} \cong \frac{0.6}{\sqrt{E/\text{GeV}}} + 0.03$  (ATLAS TDR, cone jets.)

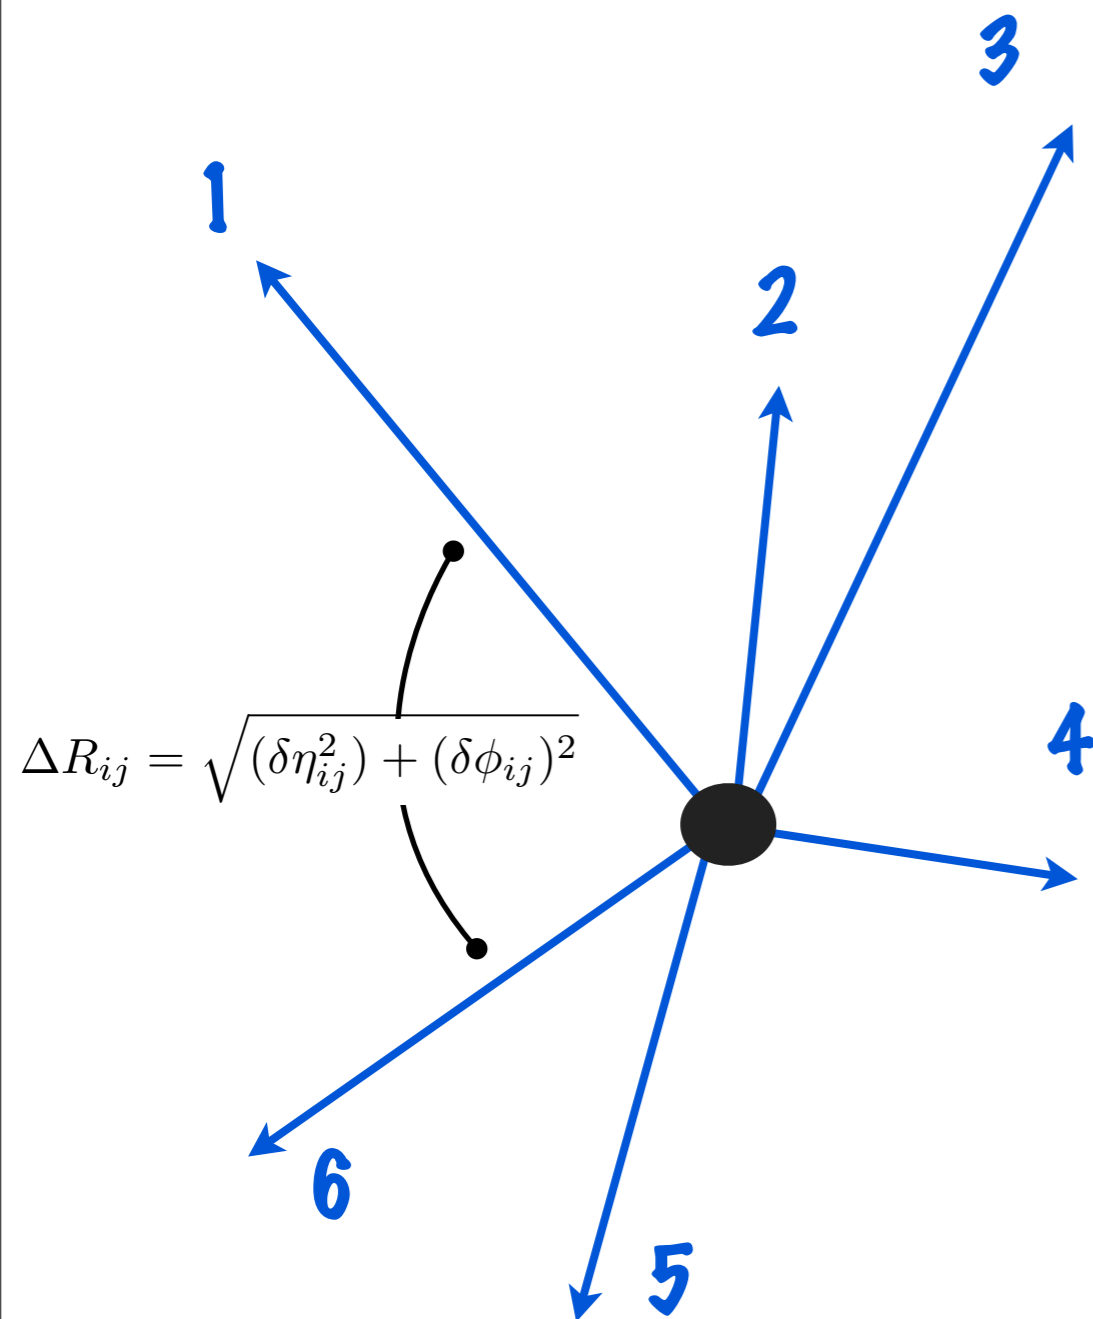

so boosted analysis are also cleaner

# Part II: Jet Substructure Analysis

- \* Combining particles**
- \* Unraveling jets/searching for substructure**
- \* Benefits of substructure**

# Making and breaking jets

to be able to better use the information contained in jets,  
we have to know how they are created

starting from a list of final particles,  
calculate:

$$d_{ij} = \min(p_{Ti}^{2n}, p_{Tj}^{2n}) \frac{\Delta R_{ij}^2}{R^2}$$

$R^2$  **jet 'area'**

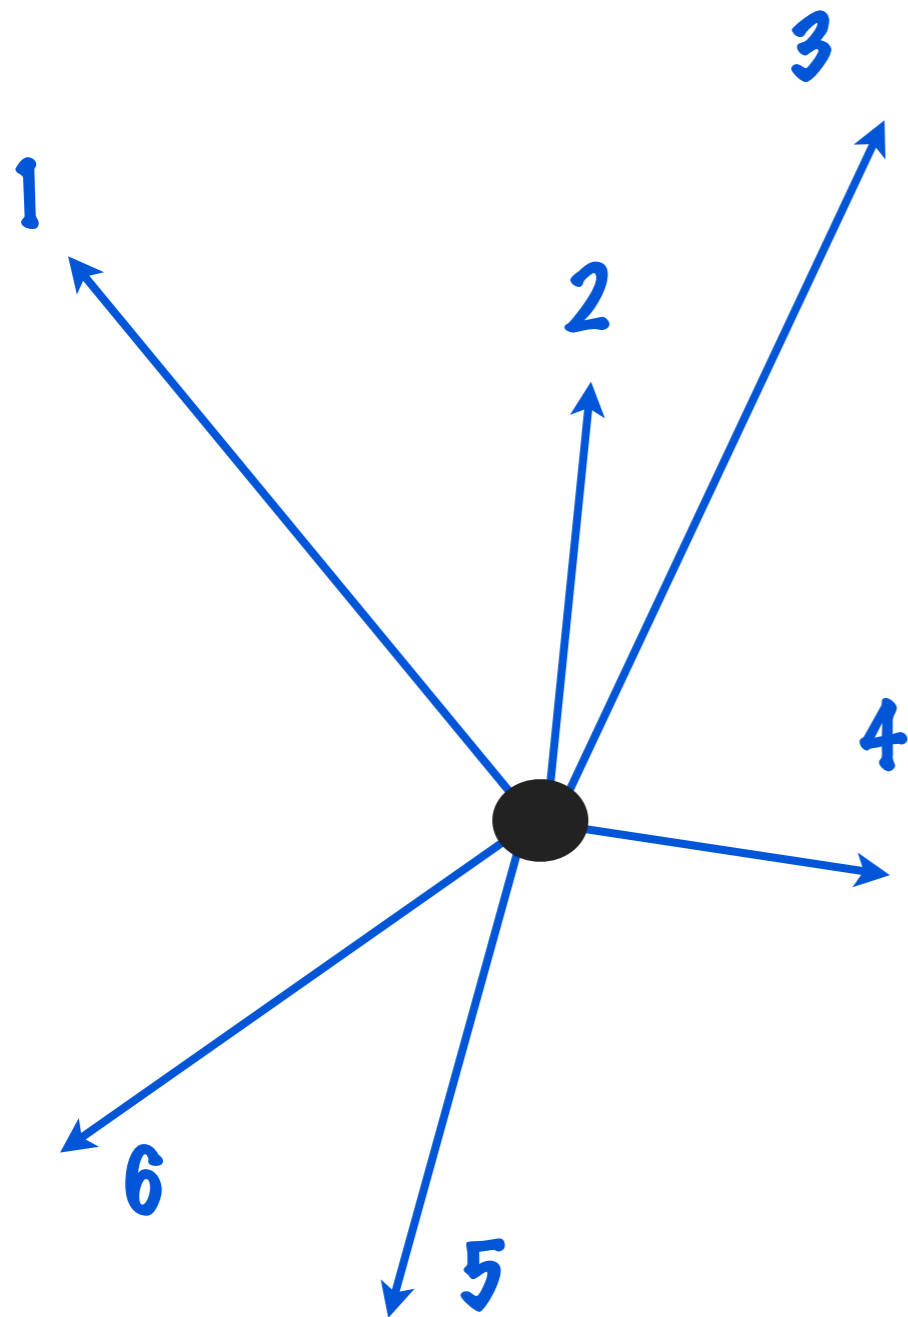

$$d_i = p_{Ti}^{2n}$$

$$n = \begin{cases} n = 1 & k_T \\ n = 0 & \text{C/A} \\ n = -1 & \text{anti-}k_T \end{cases}$$

we use the C/A (angle ordered shower)  
throughout

# Making and breaking jets

find the minimum:  $\min(d_{ij}, d_i)$

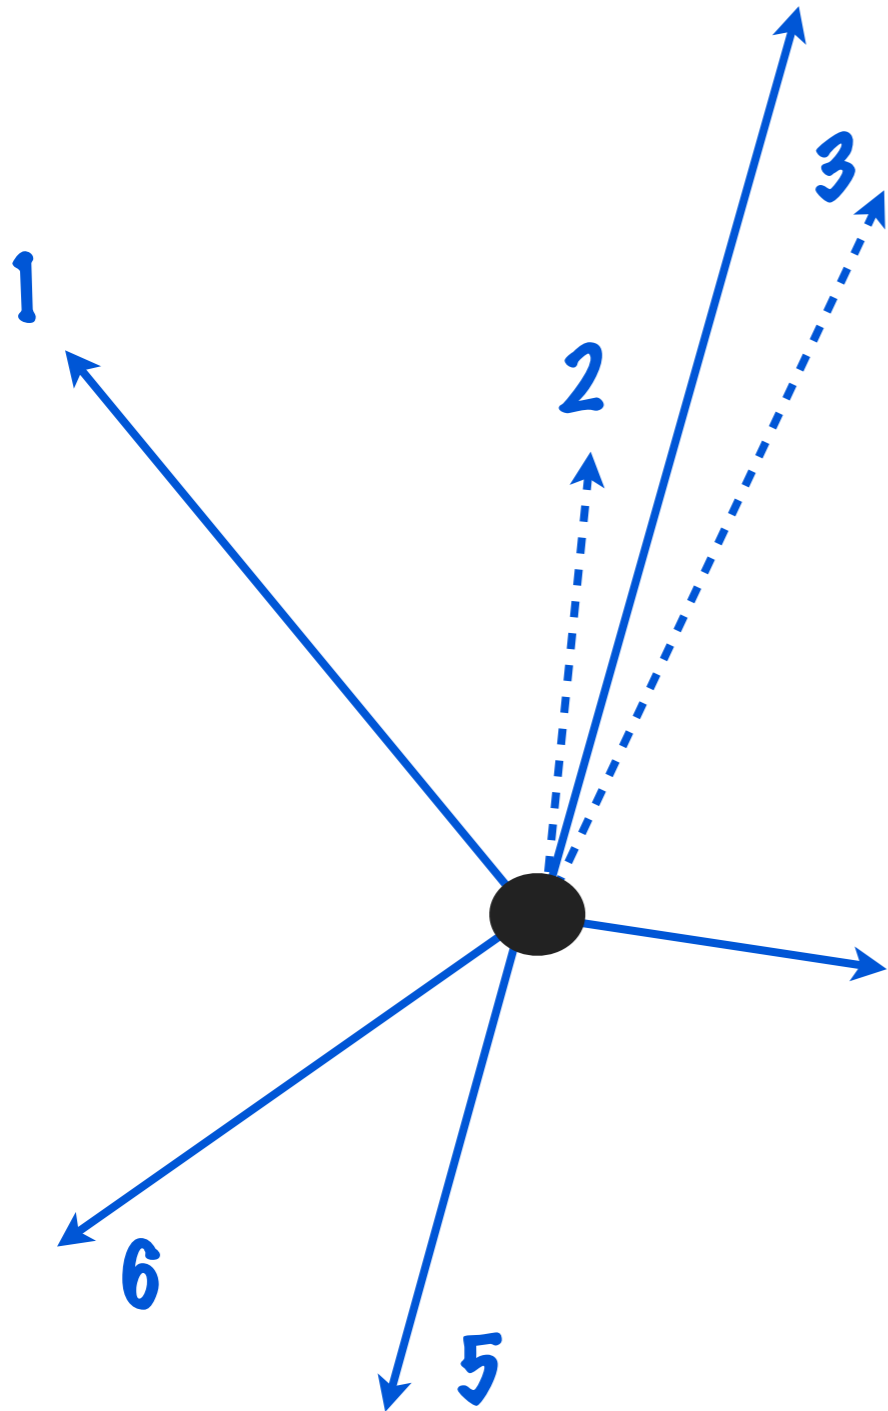

if min is one of the  $d_{ij}$ ,  
replace particle <sub>$j$</sub>  and particle <sub>$i$</sub>   
with  $\vec{k} = \vec{i} + \vec{j}$

and repeat...

# Making and breaking jets

# Jet Substructure #1

The goal is to separate jets with a heavy particle decay  
from those without

# Jet Substructure #1

The goal is to separate jets with a heavy particle decay  
from those without

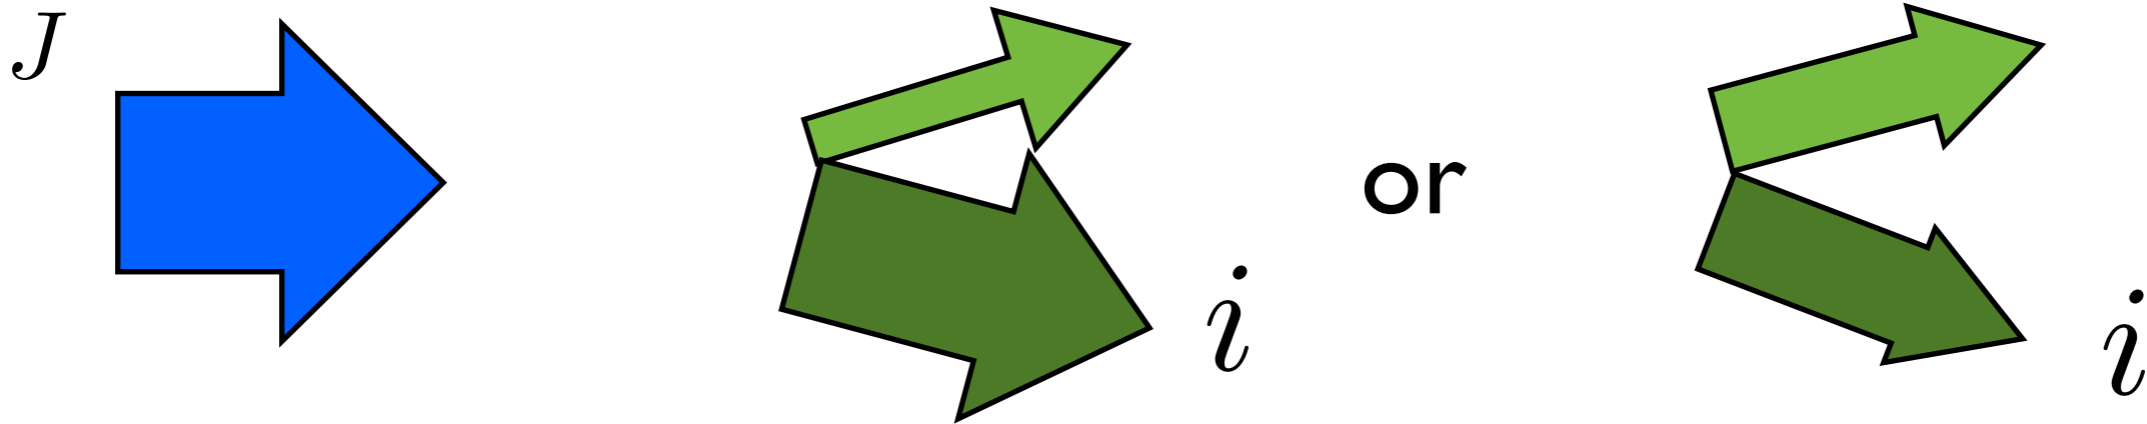

# Jet Substructure #2

(Butterworth et al  
0802.2470)

For each jet (  $R = 1.2$  ) in the event:

1. Undo the last stage of clustering  $J \rightarrow i + j$ , calling the more massive daughter  $i$ .

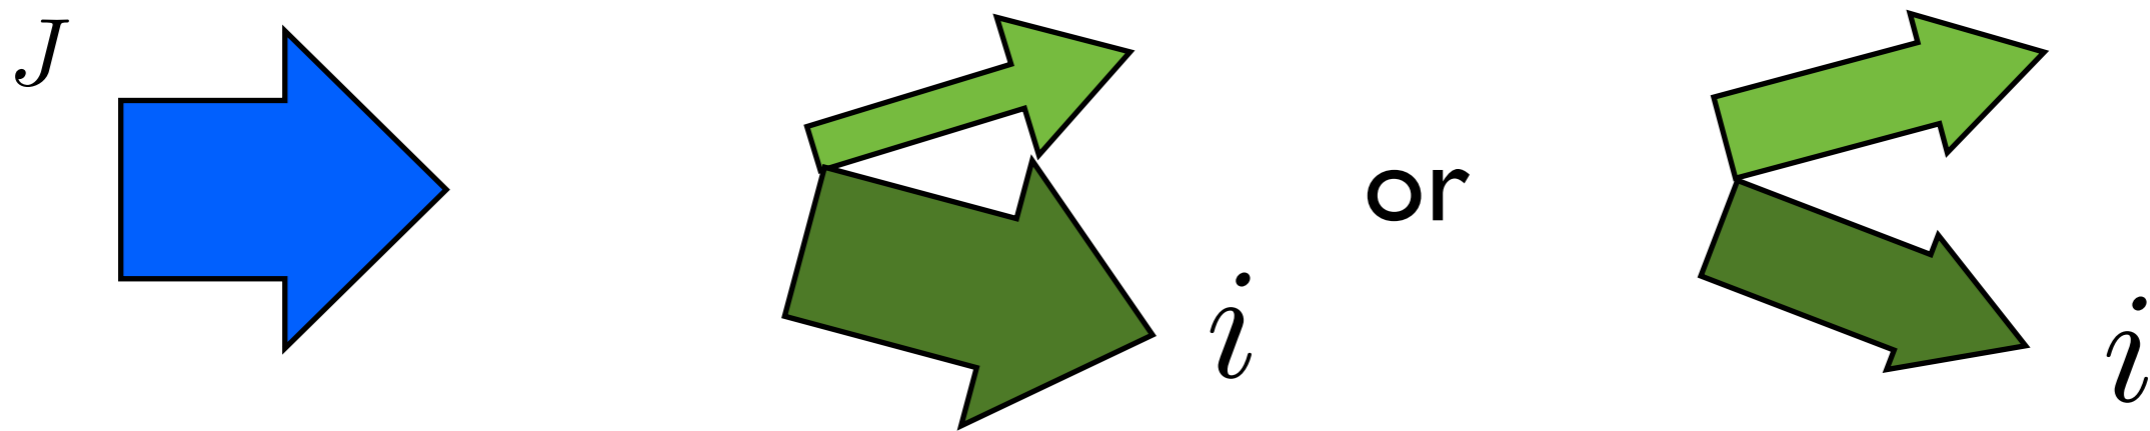

# Jet Substructure #2

(Butterworth et al  
0802.2470)

For each jet (  $R = 1.2$  ) in the event:

1. Undo the last stage of clustering  $J \rightarrow i + j$ , calling the more massive daughter  $i$ .

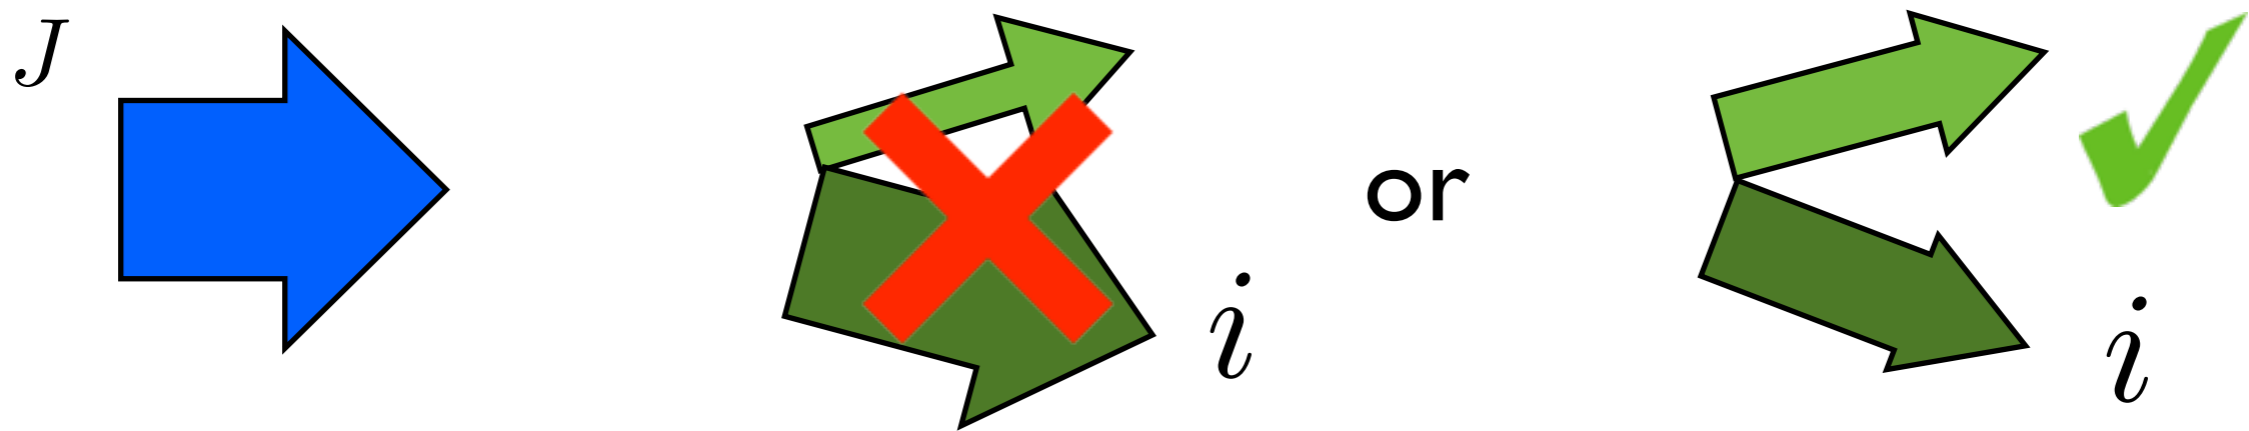

For a heavy particle decay, expect  $m_i \ll m_J$   
so only keep events with **significant mass-drop**:  $m_i < \mu m_J$

# Jet Substructure #2

(Butterworth et al  
0802.2470)

For each jet (  $R = 1.2$  ) in the event:

1. Undo the last stage of clustering  $J \rightarrow i + j$ , calling the more massive daughter  $i$ .

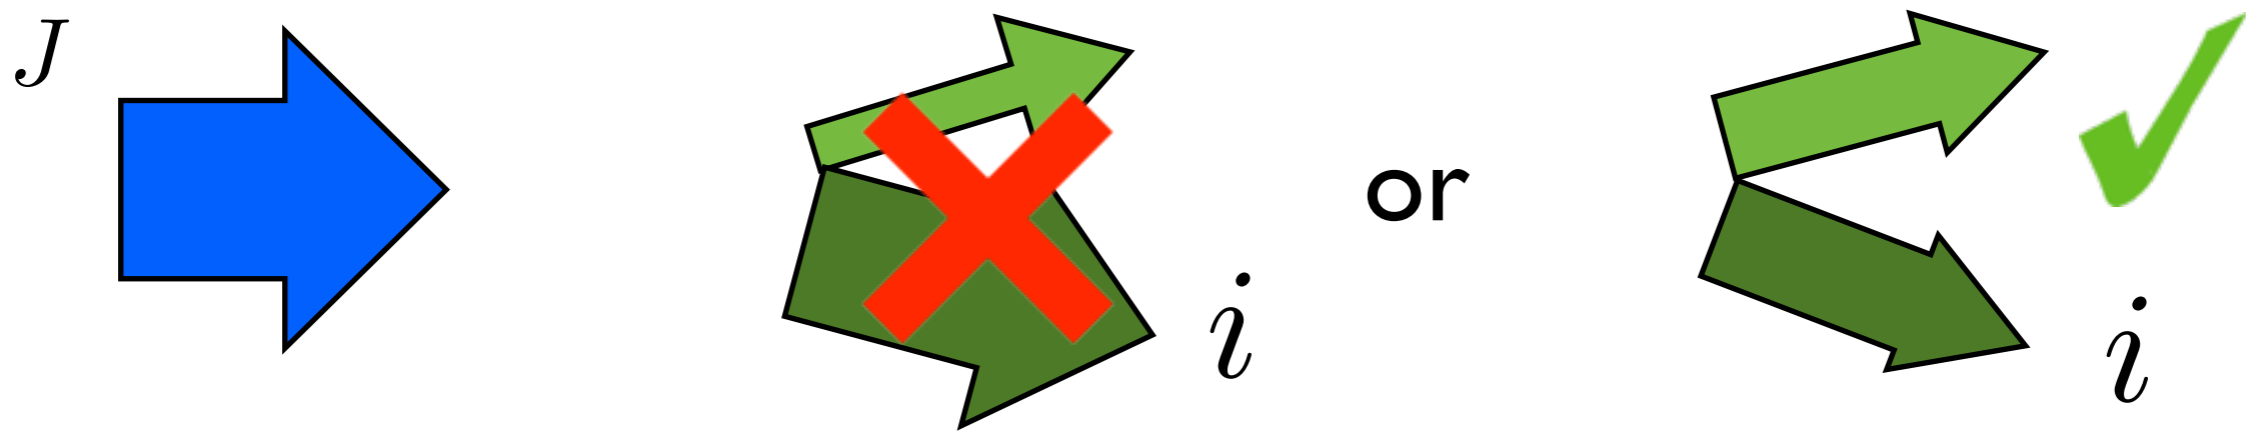

For a heavy particle decay, expect  $m_i \ll m_J$   
so only keep events with **significant mass-drop**:  $m_i < \mu m_J$

# Jet Substructure #2

(Butterworth et al  
0802.2470)

For each jet ( $R = 1.2$ ) in the event:

1. Undo the last stage of clustering  $J \rightarrow i + j$ , calling the more massive daughter  $i$ .

For a heavy particle decay, expect  $m_i \ll m_J$   
so only keep events with **significant mass-drop**:  $m_i < \mu m_J$

But rates for QCD jets/BSM jets are so high, we need  
another handle:

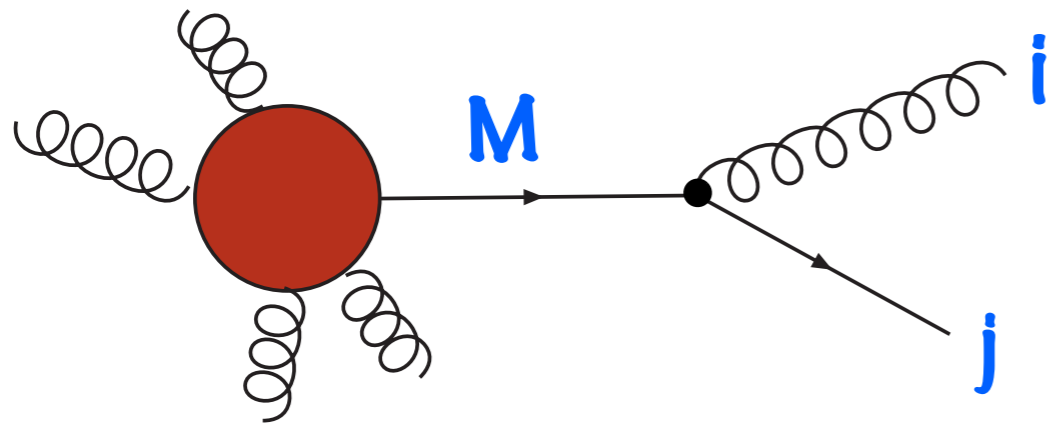

**demand:** 
$$\frac{\min(p_{T_i}^2, p_{T_j}^2)}{m_J^2} \Delta R_{ij}^2 > (0.3)^2$$

# Jet Substructure #3

for massless daughter particles:

$$\frac{\min(p_{T_i}^2, p_{T_j}^2)}{m_J^2} \Delta R_{ij}^2 \longrightarrow \frac{\min(E_i, E_j)}{E_J} \equiv z$$

... in soft, collinear limit

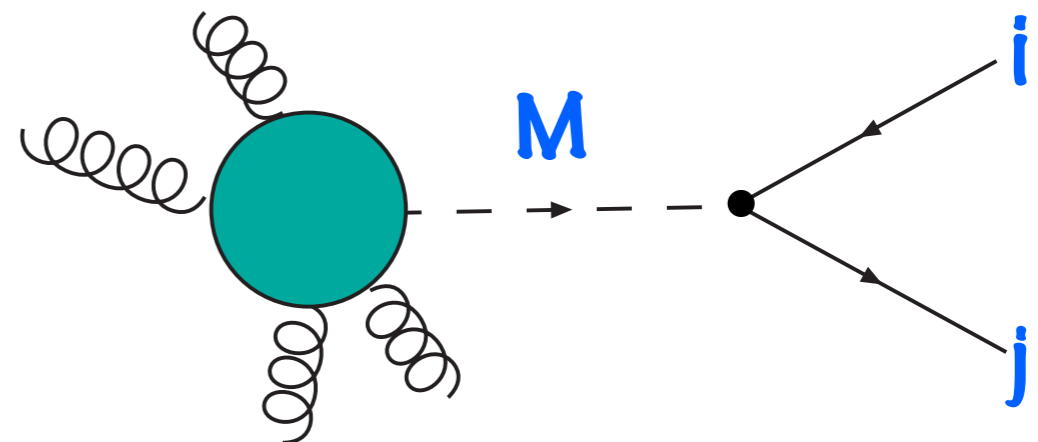

$$df_{M \rightarrow ij}^{QCD} \sim dQ_M^2 dz \frac{1}{Q_M^2} P_{M \rightarrow ij}(z)$$

blows up as  $z \rightarrow 0$

$$df_{M \rightarrow ij}^{res} \sim dQ_M^2 dz \frac{\Gamma_{M \rightarrow ij}}{\Gamma_{M,tot}} \delta(Q_M^2 - m_{res}^2)$$

nonsingular in  $z$

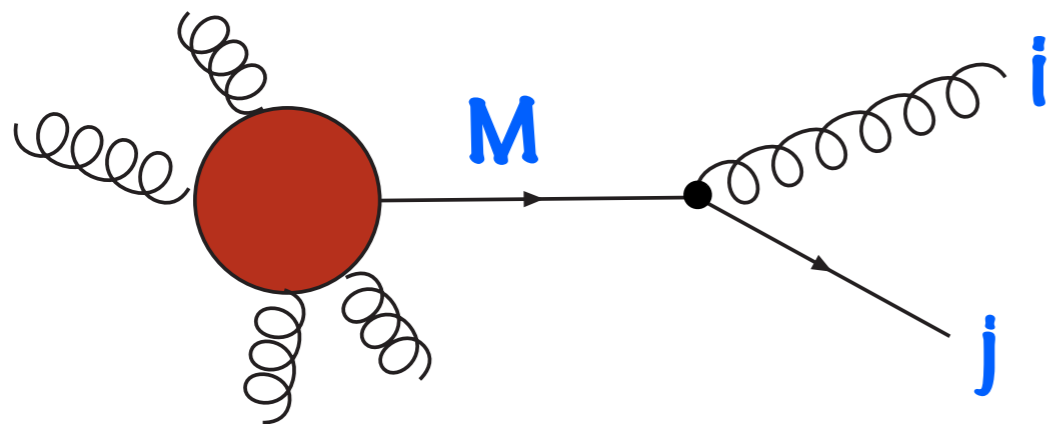

# Jet Substructure #3

for massless daughter particles:

$$\frac{\min(p_{T_i}^2, p_{T_j}^2)}{m_J^2} \Delta R_{ij}^2 \longrightarrow \frac{\min(E_i, E_j)}{E_J} \equiv z$$

... in soft, collinear limit

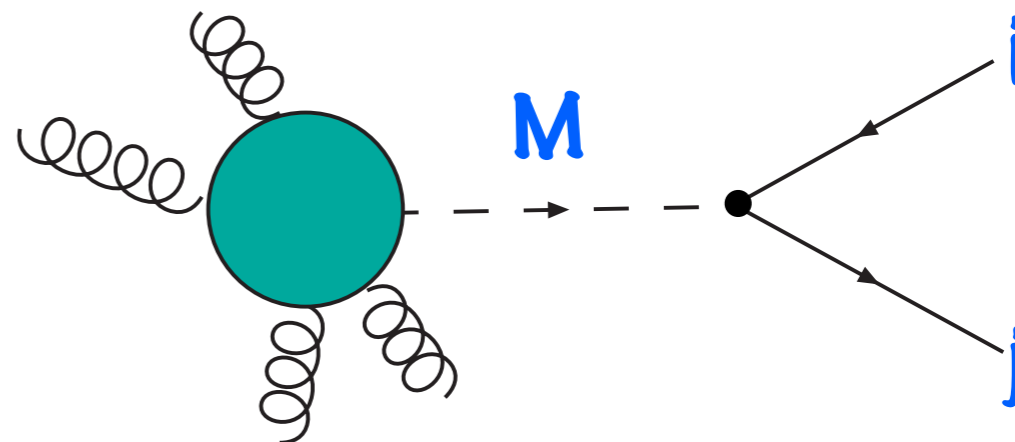

$$df_{M \rightarrow ij}^{QCD} \sim dQ_M^2 dz \frac{1}{Q_M^2} P_{M \rightarrow ij}(z)$$

blows up as  $z \rightarrow 0$

$$df_{M \rightarrow ij}^{res} \sim dQ_M^2 dz \frac{\Gamma_{M \rightarrow ij}}{\Gamma_{M,tot}} \delta(Q_M^2 - m_{res}^2)$$

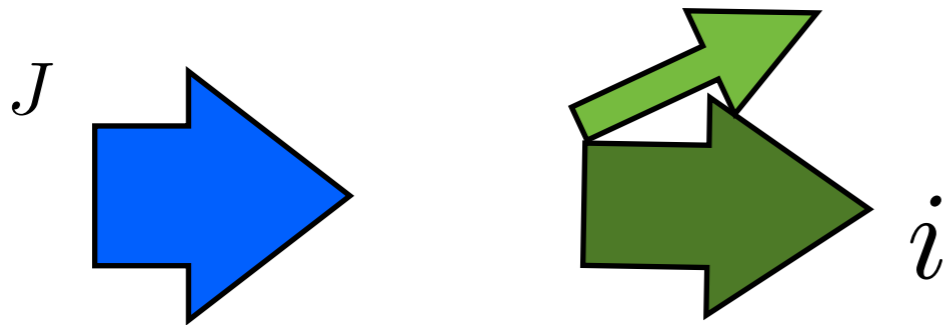

nonsingular in  $z$

cut  $\frac{\min(p_{T_i}^2, p_{T_j}^2)}{m_J^2} \Delta R_{ij}^2 > (0.3)^2$  suppresses QCD contamination

# Jet Substructure #4

2. If conditions not met, **continue unclustering** using more massive daughter jet as new parent

**BUT if both conditions met, stop unclustering**

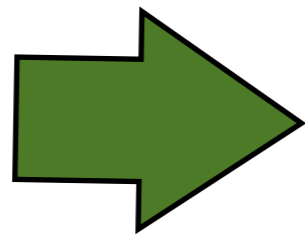

Identity  $\Delta R_{ij}$  as the substructure scale  $R_{sub}$

3. For jets with substructure, resolve at scale  $\cong R_{sub}/2$

this captures the perturbative, angle-ordered radiation associated with the subjects, while filtering out diffuse radiation like the underlying event

# Jet Substructure #4

2. If conditions not met, **continue unclustering** using more massive daughter jet as new parent

**BUT if both conditions met, stop unclustering**

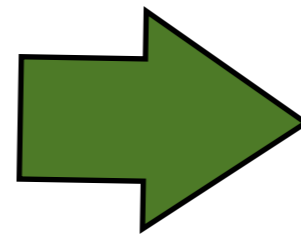

Identity  $\Delta R_{ij}$  as the substructure scale  $R_{sub}$

# Why substructure?

- Seems like we are doing a lot of work.  
Isn't there an easier way, such as:

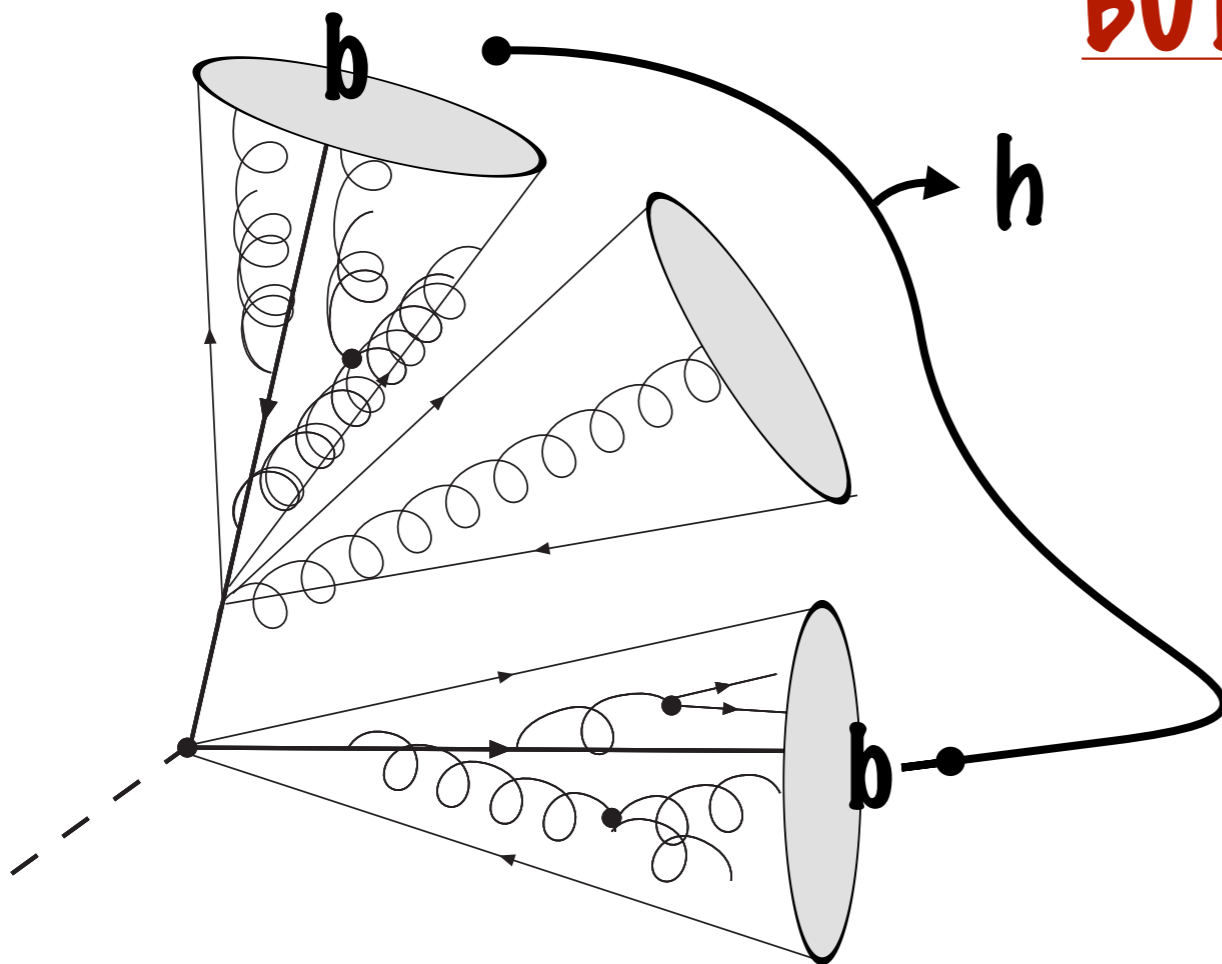

Why not just start with a smaller cone?

**BUT**

QCD radiated jets can carry much of the 'mother' particle's mass...

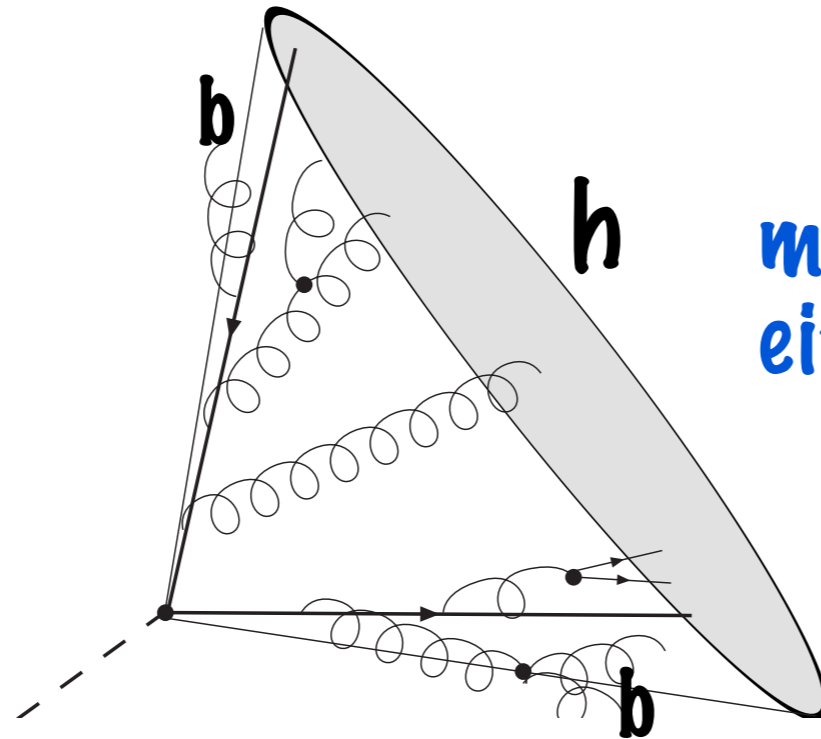

Small cones miss this mass, degrading the  $j\bar{j}$  invariant mass resolution

(Seymour, '94)

# Why substructure?

Why not a big cone, with multiple b tags?

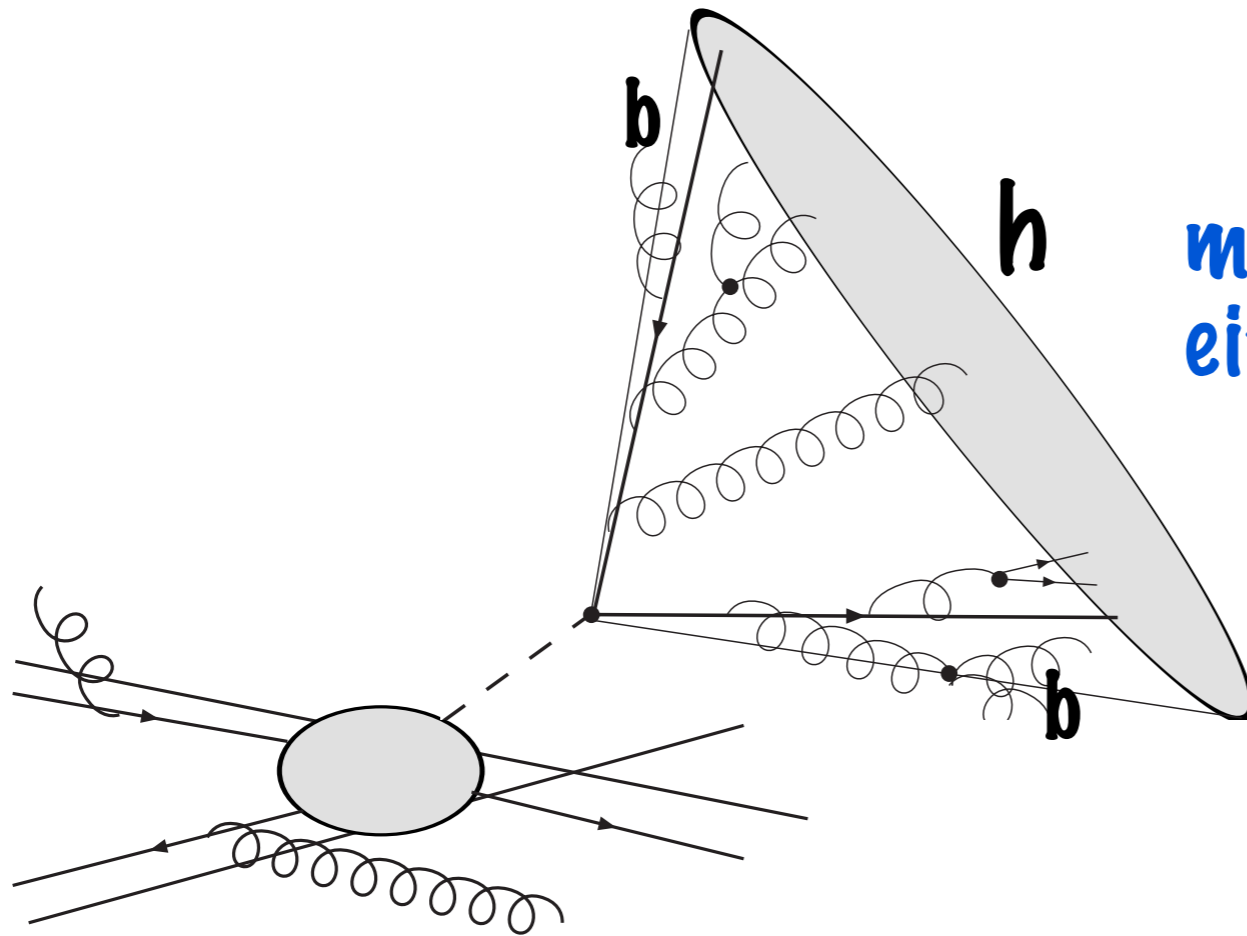

the bigger the cone, the  
more extraneous jets we allow in,  
either from radiation/underlying  
event

... leading to worse  
resolution on  $m_{jj}$

# Why substructure?

Why not a big cone, with multiple b tags?

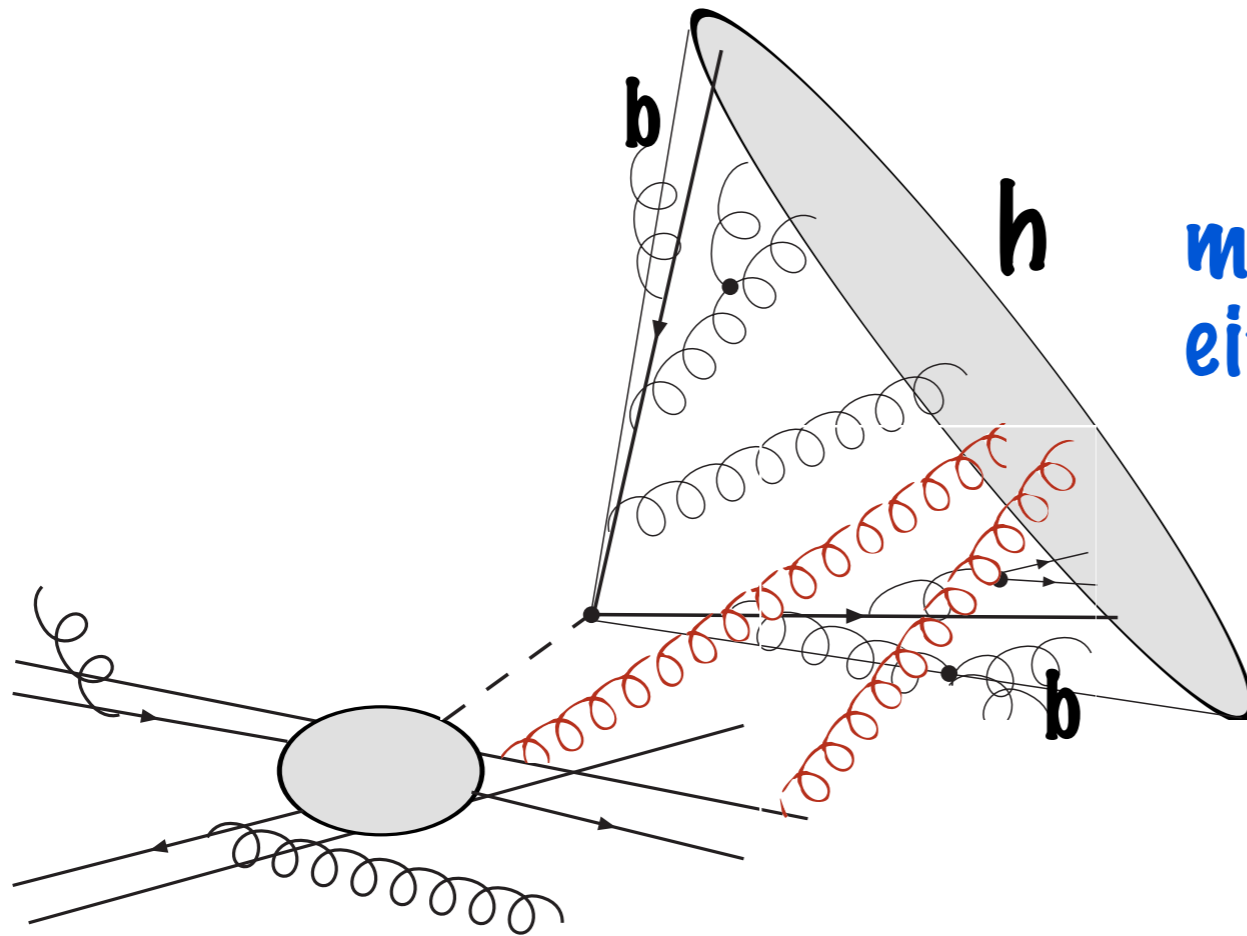

the bigger the cone, the  
more extraneous jets we allow in,  
either from radiation/underlying  
event

... leading to worse  
resolution on  $m_{jj}$

# Why substructure?

Why not a big cone, with multiple b tags?

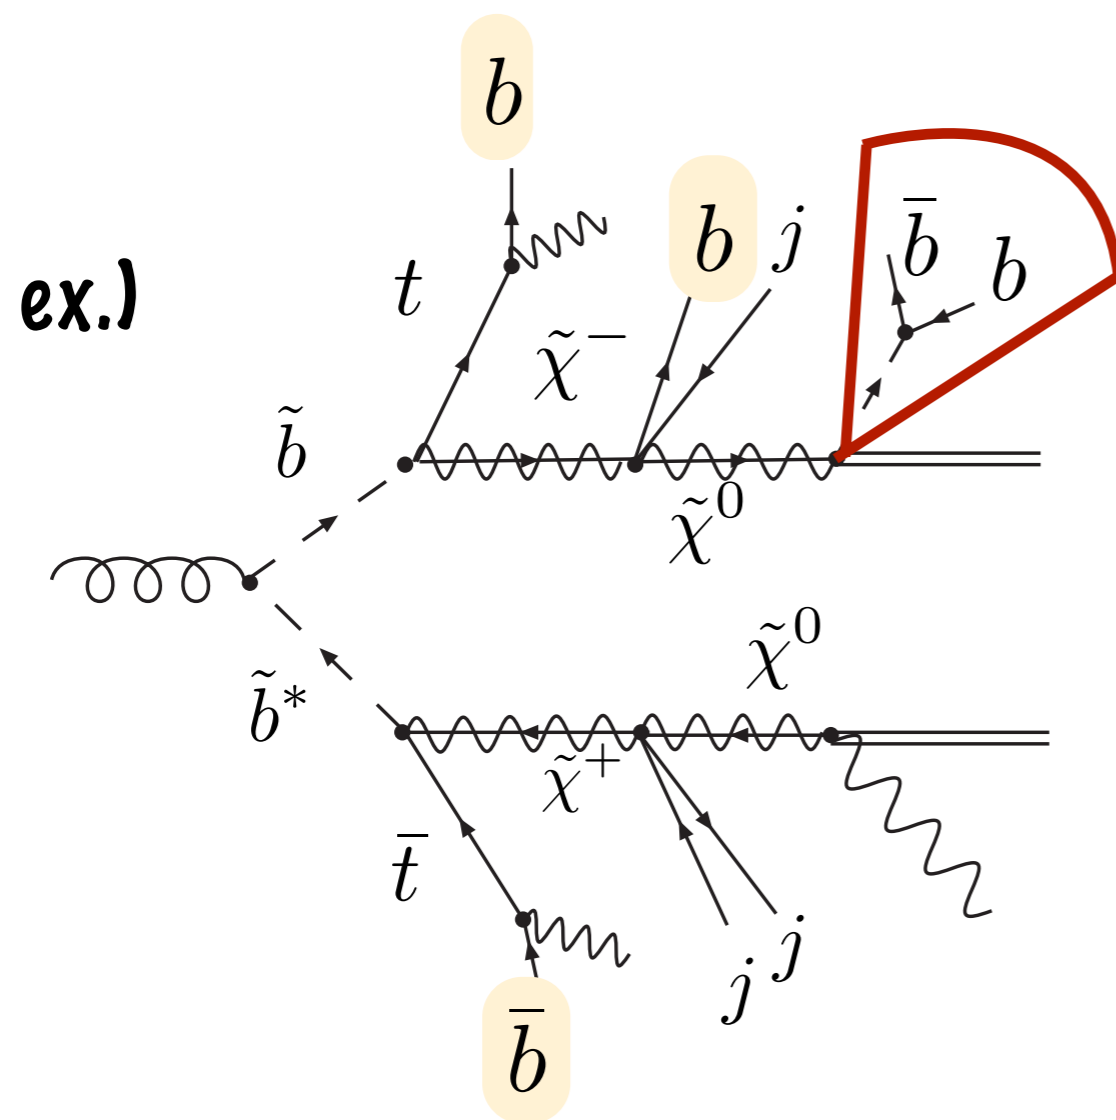

the bigger the cone, the more extraneous jets we allow in, either from radiation/underlying event

... leading to worse resolution on  $m_{jj}$

# Improved jet substructure

The large number of **b** quarks, especially when 3rd generation squarks are important in SUSY production, becomes a problem (similar to  $t\text{-}t\text{-bar-h}$  in SM)

(Plehn, Salam, Spannowsky '09)

extra b's can end up in the 'higgs jet' disrupting the substructure algorithm

identifying a pair of heavy particles is no longer enough

# Improved jet substructure

- add another handle:  $p_T$  similarity

rather than stop at a mass drop, calculate

$$S_i = \frac{\min(p_{T_{j_1}}^2, p_{T_{j_2}}^2)}{(p_{T_{j_1}} + p_{T_{j_2}})^2} \Delta R_{j_1 j_2}$$

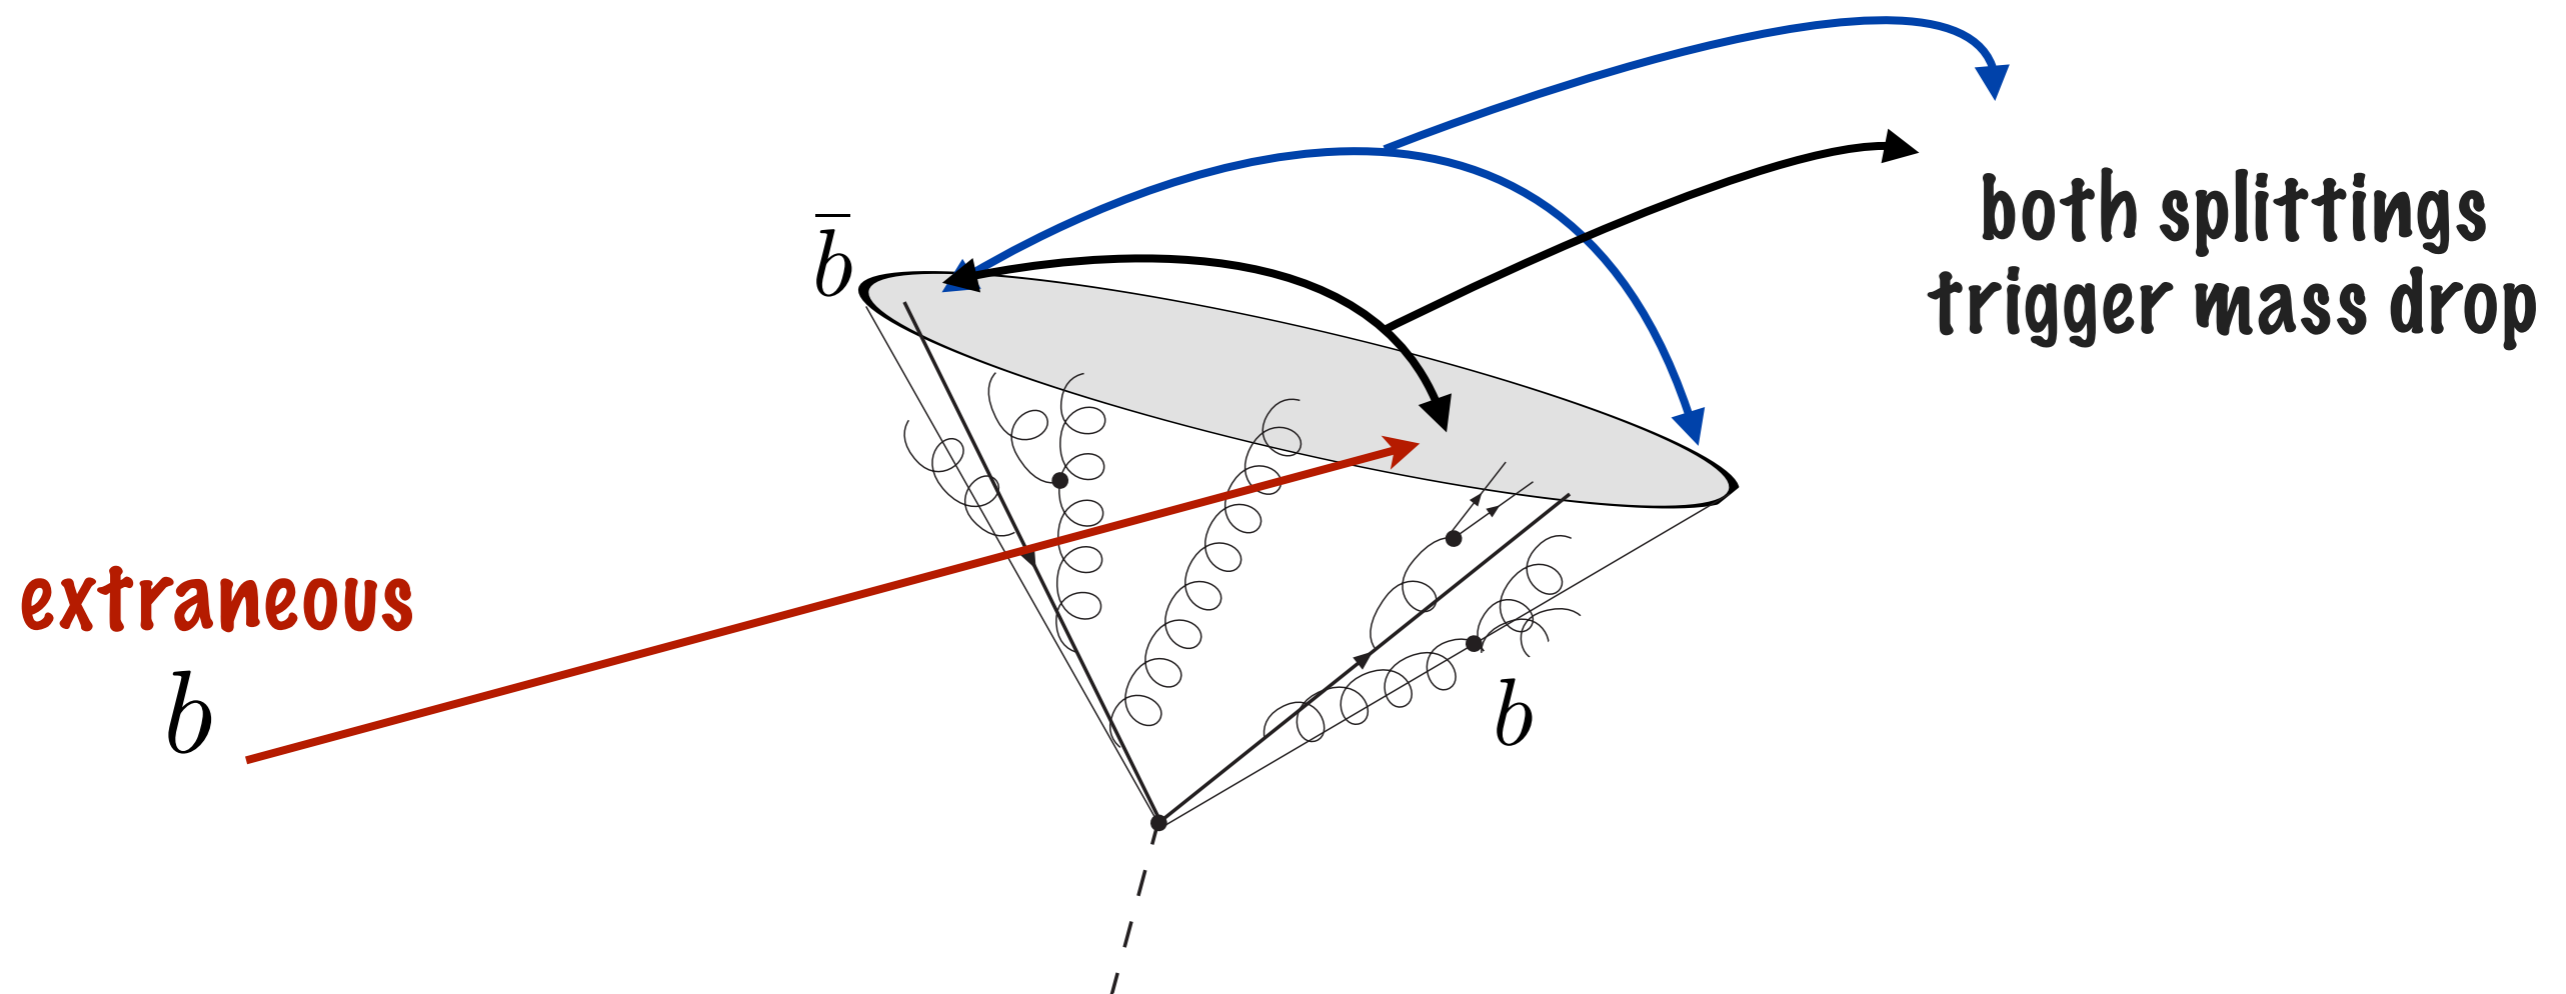

and continue undoing the original jet

at each subsequent mass drop, record  $S_i$

(Kribs, AM, Roy, Spannowsky)

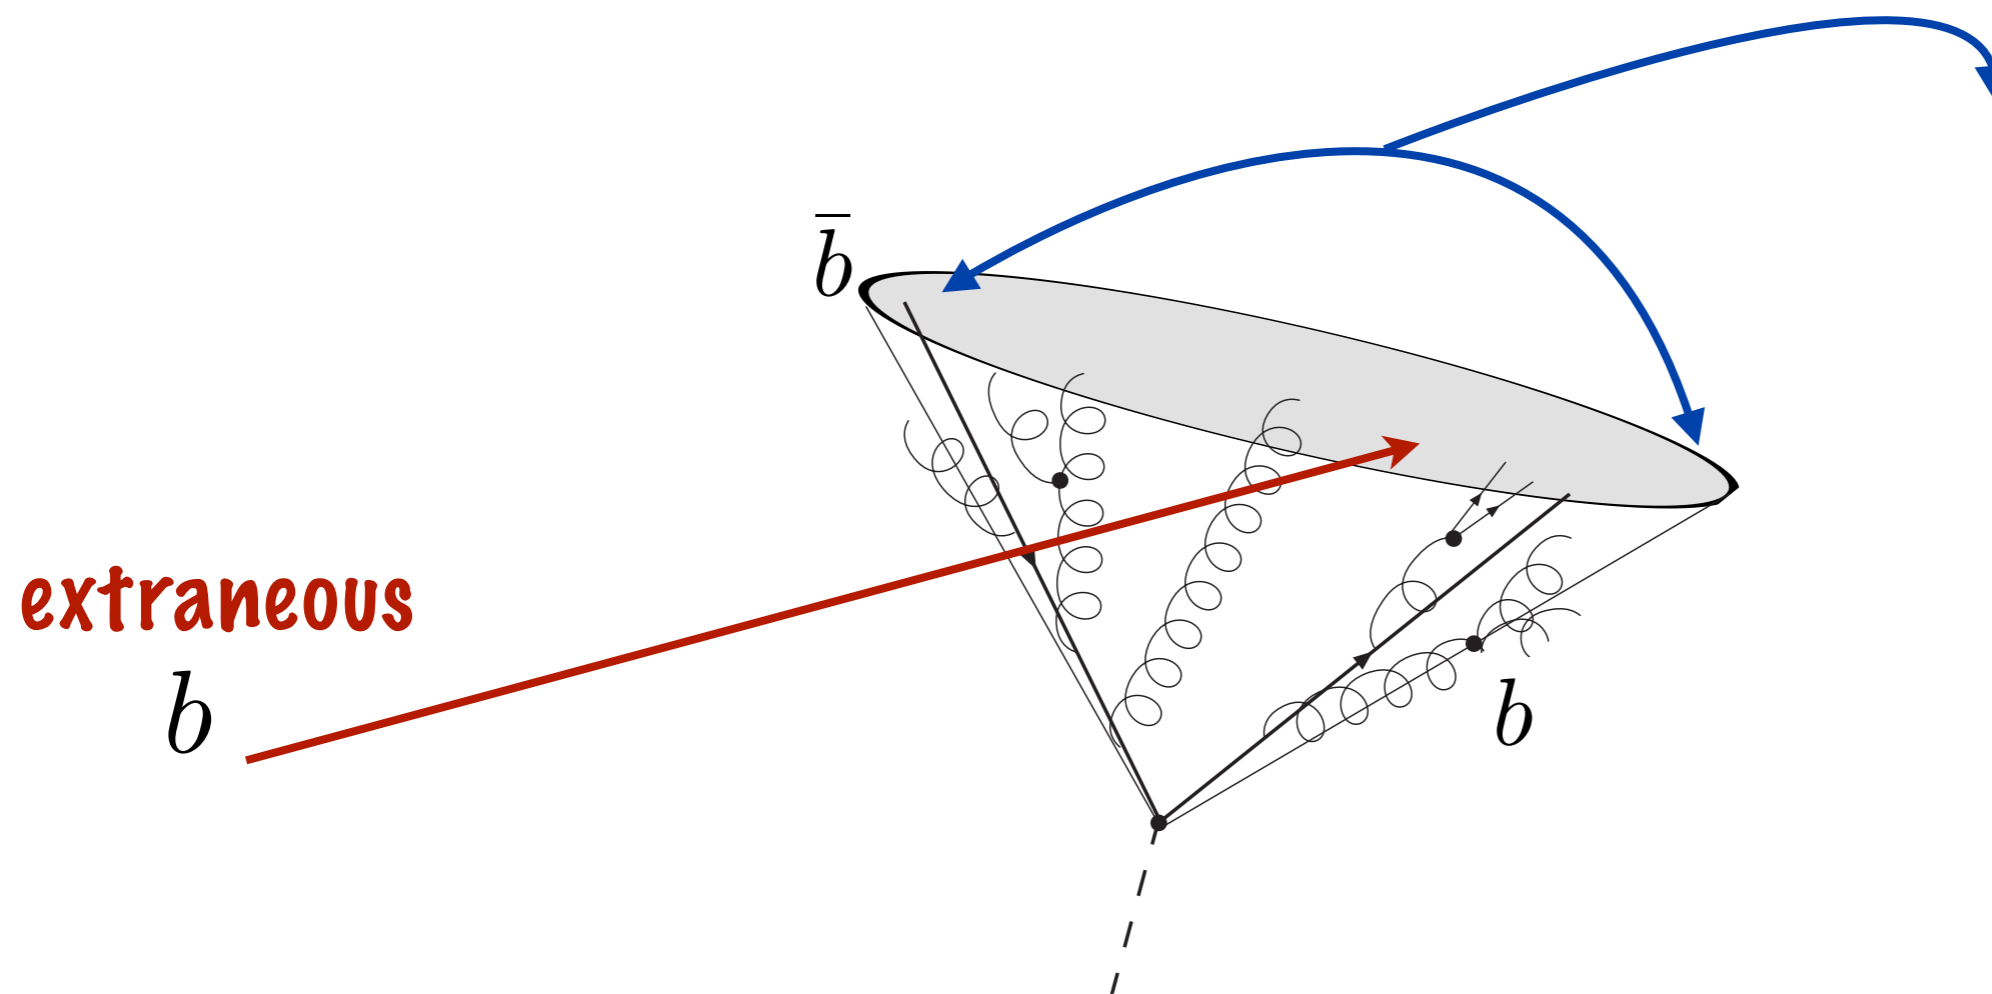

# Improved jet substructure

- Identify the splitting with maximum  $S_i$  and two daughter b-jets as the Higgs candidate

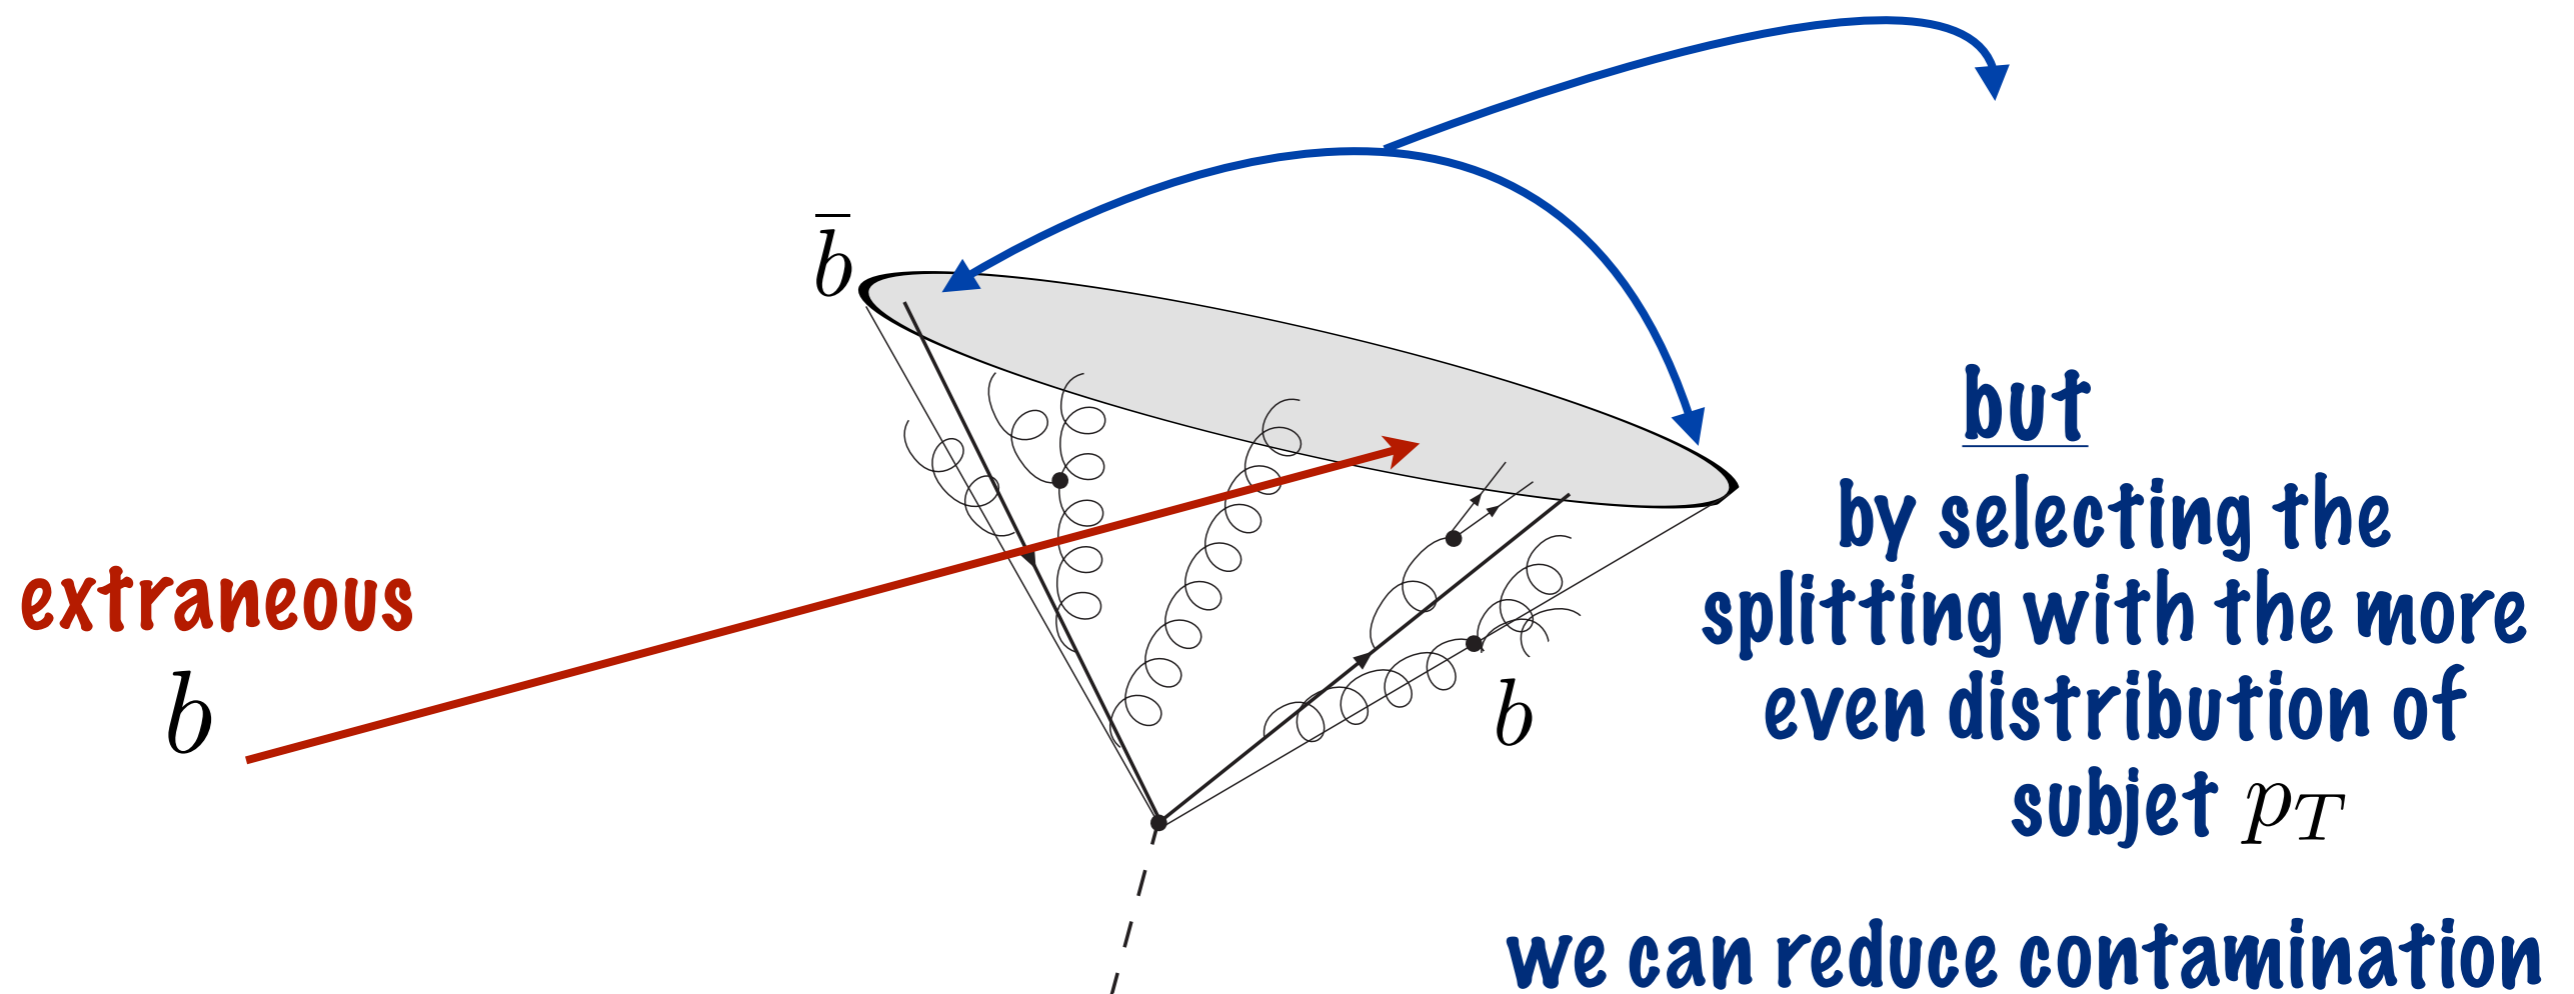

# Improved jet substructure

- Identify the splitting with maximum  $S_i$  and two daughter b-jets as the Higgs candidate

# Improved jet substructure

- Identify the splitting with maximum  $S_i$  and two daughter b-jets as the Higgs candidate

# Improved Jet Substructure on BSM:

1. cluster particles into jets,  $R = 1.2$
2. for each fat jet, undo clustering step by step, looking for **mass drop** and **even splitting of energy** between daughters.

If conditions met, record  $\Delta R_{sub,i}$  and  $S_i$ . **Keep unclustering until no more parent jets**

3. Determine which splitting  $n$  has most even  $p_T$  splitting
4. Resolve the fat jet into subjets at the scale  $\cong \Delta R_{sub,n}/2$
5. **if two of the three hardest subjets are tagged as b-jets**

**candidate Higgs jet**

**boosted analysis finds the Higgs peak even where conventional analysis fails completely or leads to confusing features**

Comparison of boosted and conventional searches

# Comments

We've used SUSY with gravitino LSP as an example source of Higgses from BSM, but the technique is **by no means limited to this**

## Ingredients:

- new, heavy particles whose decays include Higgses
- Higgs which decays primarily to  $b\bar{b}$
- some handle to suppress SM backgrounds (high- $p_T$  particles,  $\cancel{E}_T$ )

\* cleanliness of substructure analysis

better extraction of underlying parameters

ex.) SUSY w/  $\tilde{\chi}_0$  LSP  
UED  
Little Higgs  
4th Generation  
...

# Higgses from other BSM sources

moving beyond SUSY with gravitino LSP ...

# Example: SUSY with neutralino LSP

- as before, squarks dominate LHC production
- squarks decay into charginos/neutralinos  
decays to winos/binos, set by gauge couplings, dominate  
(at least for first/second generation squarks)
- provided  $M_2, M_1 \gg |\mu|$ , winos/binos are heavier than higgsinos, and subsequent decays:

$$\tilde{W}_3 \rightarrow \tilde{H}_0 + h, \quad \tilde{W}^\pm \rightarrow \tilde{H}^\pm + h$$

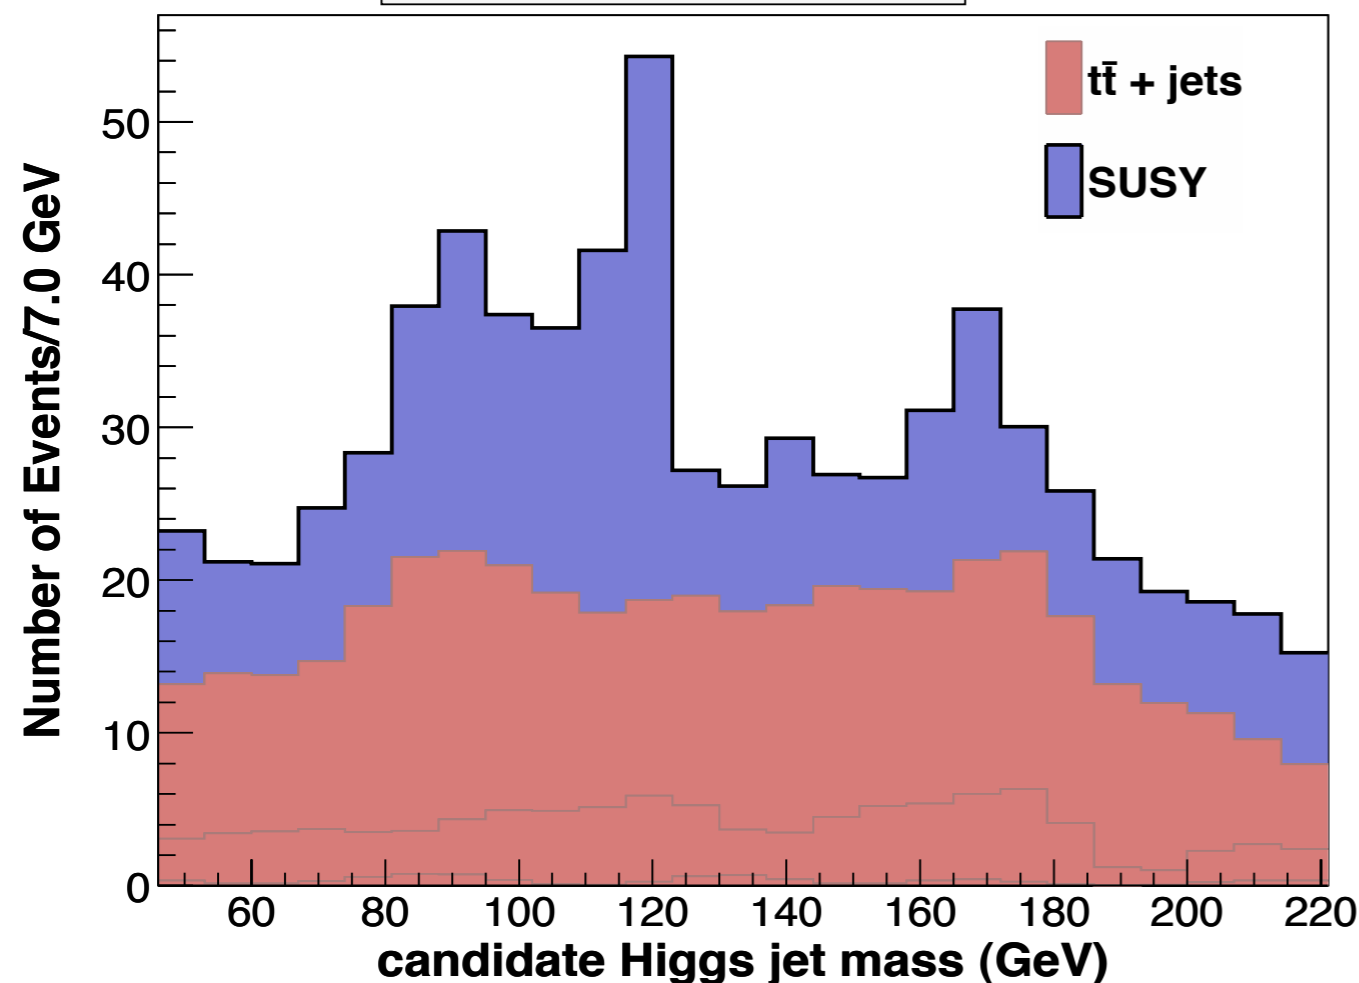

$$\tilde{B} \rightarrow \tilde{H}_0 + h$$

**all give Higgses !**

# Example: SUSY with neutralino LSP

fewer handles than  $\tilde{\chi}_0 \rightarrow h/\gamma + \tilde{G}$   
 require large  $H_T, \cancel{E}_T$  to suppress SM background

$L = 10 \text{ fb}^{-1}, \sqrt{s} = 14 \text{ TeV}$

$H_T > 1.5 \text{ TeV}, \cancel{E}_T > 150 \text{ GeV}$   
 $2^+$  high- $p_T$  jets + substructure

$m_{\tilde{Q}}$  800 GeV

$M_1$  450 GeV

$M_2$  350 GeV

$|\mu|$  150 GeV

$BR(\tilde{u}_L, \tilde{d}_L \rightarrow h + X) \sim 16\%$   
 $BR(\tilde{u}_R, \tilde{d}_R \rightarrow h + X) \sim 31\%$

careful treatment of background is needed, but looks possible

# Conclusions

Light Higgses are hard to find at the LHC ...

- \* the decays of BSM particles offer a new source of Higgses at the LHC, especially boosted Higgses
- \* The rate is smaller, but BSM often comes with handles to suppress SM backgrounds
- \* Using jet substructure analysis to fight combinatorial BSM backgrounds, result is new channels to discover  $h \rightarrow \bar{b}b$   
improved substructure extends this to 'b-rich' environments
- Complementary to conventional Higgs searches, smaller jet-resolution effects
- These new Higgs discovery channels can easily be as significant (or more so !) than conventional  $h \rightarrow \gamma\gamma$
